Problem is that a good copy program will copy the sector and
ignore the faulty checksum. So you will end up with a perfect
copy including the error. But you will at least fool the desktop
and a few "not-so-good" copy programs...

> Second..Anyone else any ideas for copy protecting a disk ?

I think that writing info between the sectors is the way to go.

Hello everybody,
My question is about MAGIC MAC/PC ...
Is there any cookie specific for MAGIC MAC/PC ?
Which are these cookies ?
Thanks, bye for now...

Hello Tony,

Have you seen CD-Secure 2 by C-Dilla Ltd? Our software prevents any
copying of the disc by taking a random record of the machine's
environment like a fingerprint and binding the discs to that individual
machine. Any copies taken will only work on one machine unless they ring
you and ask permission and you exchange codes...and possibly money too.

> operations, it has a sine/cosine table already in ROM.

True in general, but the JPEGD.PRG particularly does *not* use
builtin sine/cosine table. The reason is that the IDCT (Inverse
Discrete Cosine Transform) does only need the cosine values at
a few discrete points, which can be precalculated and used as
inline constants or constant tables in practice. In fact, all
practical IDCT implementations take this approach.

You are right that the DSP's superior performance in this regard
is mainly due to its efficient (and accurate!) multiply-and-add
type operations (MAC and MACR instructions).
BTW, the DSP is still superior in architecture compared to the
recent "MMX technology" from Intel.
See for example Intel's sample IDCT implementation for MMX under

http://developer.intel.com/drg/mmx/appnotes/ap528.htm

They use the 'quick-and-dirty' (fast but less accurate) AAN
(Arai, Agui & Nakajima) integer IDCT method, because the more
accurate (but still fast IMHO) LLM (Loeffler, Ligtenberg &
Moschytz) algorithm didn't provide sufficient speedup on
the MMX.
The DSP, however, can perform accurate IDCT methods *without*
losing performance!

BTW, the current JPEG library from the IJG (Independent JPEG
Group) provides both (AAN & LLM) IDCT algorithms (see files
'jidctfst.c' and 'jidctint.c' respectively).
1stGuide, for instance, uses an 68000-assembly optimized
version of the more accurate LLM method internally for
maximum output quality :-).

I am looking for the MIDI file format -- a friend of mine is writing a program for his 3rd year project at Uni that composes music, and he wants to be able to listen to it. So we're looking for the MIDI file format so we can get it onto my Atari.

There's probably a better place to post a request for this, but I thought I'd try here first.

Cheers,

James Cox

Source record: 7461

PS: There is an IEEE (Institute of Electrical and Electronics
Engineers) standard (No. 1180-1990) for required accuracy
of IDCT implementations, to which the JPEG and MPEG standards
refer.
Recently there was rumor in Usenet that IEEE has withdrawn
this standard just because Intel's proposed MMX AAN IDCT
implementation failed the conformance tests :-/.
The LLM method (with appropriate implementation), however,
does conform to the accuracy requirements of that standard.

Regards,
Guido

4714. Anyone intersted in doing the FIGlet 2.2 port for Atari?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-18 00:00:00 UTC
From: chai@chip.cs.uiuc.edu
Message-ID: <chai.856305788@chip.cs.uiuc.edu>
Source record: 7463

Hello.

FIGlet is a freeware program that

```
_ _ _ _
__| | ___ ___ ___ | |_| |__ (_)_ __ __ _ ___
/ _` |/ _ \ / _ \/ __| | __| '_ \| | '_ \ / _` / __|
| (_| | (_) | __/\__ \ | |_| | | | | | | | (_| \__ \
\__,_|\___/ \___||___/ \__|_| |_|_|_| |_|\__, |___/
|___/
_ _ _
| | o | | | | o
| | | | _ _|_ | | ,
|/ | |/_) |/ | |/ \ | / \_
|__/|_/| \_/|__/ |_/| |_/|_/ \/
```

Someone did a port for the Atari for an older version, but I lost
contact with them. If any of you is interested to do this port, feel
free to grab the source code from the unix distribution from either the
ftp site ftp.nicoh.com in the pub/figlet/program/unix directory, or
from the web site http://st-www.cs.uiuc.edu/users/chai/figlet.html#who

When you're done, upload it to the pub/figlet/incoming directory and
email me and I'll put it in the proper place, and announce it to
FIGLET-L.

READ THIS!!!!

NEW VERSION ! 1997 (Legal Questions Addressed!)

(Excerpt From Bob Novak Who Started This New Version)

In late October of 1996, I saw an article in an internet newsgroup telling me that I could make $50,000 within a month for an investment of only $5. I thought, "OH YAH!! I'VE GOT A BRIDGE I'LL SELL YOU TOO!!" It sounded like all the rest of the "get rich quick" schemes and scams I've seen over the past 40 years or so.

I spoke to my attorney, a few friends, and family about it, and they all agreed it was some kind of scam. I can't stand scams, because usually someone gets burned, and I didn't want it to be me. After rejecting the idea at first, it kind of played on my mind and I thought, "what if it really worked?" I realized all I had to lose was $5.00, I usually blow that much on the lottery every week anyway, so I figured what the heck, and decided to give it a shot.

Within two weeks I began receiving money in the mail! Soon, hundreds, and then thousands of dollars began to roll in. Within 4 weeks, I had received a total of $46,812.00! It came from everywhere in the world." Lately, I've doubled my efforts and the money is rolling in even faster. I would tell you how much but then the IRS would know also, let's just say it's a VERY comfortable living. Now, I am really going to work! If I can make as much as I have, and still am, on a lousy $5.00 investment, why not double it and make the "Big Bucks" twice as fast? Anybody can afford to gamble $10.00 on a chance to make $100,000.00 or more in a month, especially when the business has already proven itself.

If you follow the three steps below, there is no reason why the same shouldn't happen to you! This is a legitimate investment opportunity. You invest $10, and you receive a return on your investment. So does the next investor. THIS IS NOT ILLEGAL, THIS IS NOT A CHAIN LETTER, THIS IS PERFECTLY LEGITIMATE. (See additional legal details below.)

THE PROCEEDURE IS SIMPLE:

1) Invest your $10 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending two dollars to someone; you're paying for a legitimate service.) Fold two $1 U.S. Treasury bills, money order, or bank note inside each piece of paper, and mail them by standard U. S. Mail to the following five addresses:

1. David Wiseman
P. O. Box 1648
Clarenville, NF A0E 1J0
Canada

2. Sean Bennett
#605 - 9825 103 St
Edmonton, AB T5K 2M3
Canada

3. Gregory Pang
Box 60367
U of A postal outlet
Edmonton, AB T6G 2S6
Canada

4. Pawel Koper
#4-7120 Pandora St.
Burnaby, BC
V5A 1B7
Canada

5. Thomas Walter
Parsbergstr. 14
82110 Germering
Germany

2) Now remove the top name from the list, and move the other four names up. In other words, #5 becomes #4 and so on. Put your name as the fifth one on the list. You can do this by simply retyping the article or reposting it to other newsgroups with the edited addresses.

3) Post the article to at least 200 newsgroups. There are 22,000, so it shouldn't be hard to find that many. Remember, there are no "Free Lunches" in this world so the harder you work the more money you will make.

You are now in the mail order investment business, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return will be. If you wish to remain anonymous, you may use a pseudonym, but make sure your address is correct.

LEGAL ? ? ?

People have asked me if this is really legal. It is! You are using the Internet to advertise your business. What is that business? You are assembling a mailing list of people who are interested in home based computer and online businesses and methods of generating income at home. Remember - people send you a small fee to be added to your list. It is legal. What will you do with your list of thousands of names? That's up to you.

NOW HERE IS WHY THE SYSTEM WORKS:

The internet is growing at a tremendous rate - it doubles in size every 4 months. Think about it. You see those "Make Money Fast" posts more and more. All that growth means profits for everyone who participates. There are no losers.

Of every 200 posts I made, I received 5 responses. That probably doesn't seem like much. You make $10 for every 200 posts with your name at #5.

Each person who sent you $2 now also makes 200 additional postings with your name at #4. i.e.. 1000 postings. On average therefore, 50 people will send you $2 with your name at #4. $100.00.

Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people=$1,000.00. They make 200 postings each with your name at #2=100,000 postings=5000 return at $2 each=$10,000.

Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $100,000 before your name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE MAKES ONLY 200 POSTINGS! Total income in one cycle = $100,000.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $10, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline. The more you post, the greater the return.

Lets review why you should do this. THE ONLY COST IS $10, AND 5 STAMPS, AND 5 ENVELOPES. Anyone can afford $10 for such an effortless investment with such SPECTACULAR RETURNS.

Some people have said to me, "what happens if the scheme is played out and no one sends me any money?" Big Deal, so you lose $10.00 but what are the chances of that happening? SINCE THIS IS A BRAND NEW PROGRAM AS OF JANUARY 1, 1997, YOU'RE IN ON THE GROUND FLOOR!

There are millions of internet users, and millions of new net surfers every month.

Remember- read the instructions carefully, and play fairly. THAT'S the only way this will work. Get a printout so you can refer back to this article easily.

Keep a list of everyone that sends you money, keep good books, pay your taxes, and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER-HONESTY IS THE BEST POLICY. WHAT ARE 10 DOLLARS TO YOU? YOU DON'T NEED TO CHEAT THIS IDEA TO MAKE MONEY!!! (We will monitor the program and if we find you have cheated by not sending your money to your five recipients, we will just dump you out of the system). This is the easiest way that you can make a buck. Think how excited you'll be to open up your mailbox day after day! Will it be $50? or $5,000? Start making your plans, because it can happen to you.

DON'T PASS UP THIS ONCE IN A LIFETIME OPPORTUNITY!!!

Extra section:
HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

The Fastest Way To Post To a Newsletter:

Simply highlight and COPY (Ctrl-C for copy) the text this e-mail message and PASTE it into a text editor such as Notepad and SAVE it (as a .txt file).

After you have made the necessary changes that are outlined above, Simply COPY and PASTE the text into the message section of the message composition window and to be posted to the Newsgroup and post it!

If you have Netscape 3.0 do EXACTLY the following:

1) Click on any news group like normal, THEN click on 'TO NEWS', which is on the far left when you're in the newsgroups page. This will bring up a box to type a message in.

2) Leave the newsgroup box like it is, CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE

$$$" or "FAST CASH"!!!

3) Tab once and you should be ready to type. Now, retype (only once)
THIS whole article WORD FOR WORD, except insert your name at #5, and remove #1 off the list, plus any other small changes you think you need to make. Keep almost all of it the SAME!

4) When you're done typing the WHOLE article, click on FILE in THIS BOX, RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST BOX.

Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to number 5 below.

NOTE: If you don't want to type in the whole article by hand, AND you know how to use a plain text editor (like Notepad), you can edit the file ahead of time, then attach it as shown in step 6.

5) If you still have all of your text, send or post to this newsgroup now by just clicking send, which is right below FILE, and right above Cc:.

6) Here's where you're going to post all 200. OK, click on any news group then click on 'TO NEWS', again in the top left corner. Leave the NEWSGROUPS BOX alone again, put a flashy subject title in the SUBJECT BOX, hit TAB once you're in the body of the message. Click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find YOUR file that you saved; click on the file, and then click 'OPEN' now click on OK; if you did this right, you should see your file name in the attachments box, and it will be shaded green.

Note: If you don't want to type in the whole article and you know how to use a plain text editor (Notepad), you can edit the file ahead of time, then attach it.

QUICK TIP!

You can post this message to many newsgroups at a time by simply selecting a newsgroup near the top of the screen, hold down the SHIFT key, and then select a newsgroup near the botton of the screen. All of the newsgroup in-between will also be selected.

IF YOU USE IE EXPLORER IT'S JUST AS EASY...HOLDING DOWN THE LEFT MOUSE BUTTON, highlight this article. then press the "crtl" key and the "c" key at the same time to copy this article. then print this article for your records, to have

the names of those you will be sending $1 bills to.

2) Go to the news groups and press "post an article". A window will open. Type in your headline in the subject area and then click in the large window below. Press "crtl" and then "v" and the article will be placed in the window.

If you want to edit the article, do so and then highlight and copy it again. Now every time you post the article in a new newsgroup all you have to repeat is "ctrl" and "v" and press post.

3) That's it. Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups, or more.

You see? Now you just have 199 to go!! (Don't worry, each one takes about 30 seconds, once you get used to it.)

REMEMBER 200 IS THE MINIMUM. The more you post the more money you will receive. AND THAT'S ALL THERE IS TO IT!!!

DON'T LET THIS ONCE IN A LIFETIME OPPORTUNITY PASS YOU BY!

4716. ST Timers

```
c > I know that this could be done with the 200Hz clock at $4bc,
c > but I'm not sure this would be accurate since there is the
c > possibility of overflow occuring.

The 200Hz clock is driven by Timer C, so using Timer C directly is
no more accurate than using the long counter at $4BC. As for
overflow, subtracting the start time should always give you the
correct elapsed time (unless you were planning to let it run for
several days).

Only Timer A is not used by the OS, unless you have DMA sound (which
uses Timer A for the frame counter). If you have a TT or Falcon,
you have a second MFP with another set of timers, of which only
Timer D is used (Serial 1 Baud Rate, TT only).

Right then!

The ST timers are created by theMFP68901 chip.
There are 4 timers, timers A,B,C, and D.

Each timer has a control register, and a data register.

The main MFP clock is 2,457,600 Hz (This is entirely from
memory! Impressive huh?)

The timer control registers allow the main clock to be divided
down, e.g. /4, /10, /16, /100, /100.

The timer data regs tell the MFP how many clock pulses to
count before setting an interrupt.

E.G. 2,457,600 / 200 = 12.288 KHz

Data register = 61
hence timer frequency = 12.288 KHz /61
= 201.4Hz

In general it is better to use timer A, as it is not used by
the system! (Avoids crashes!)

Hope this helps!

brian.

It's an implementation of evnt_multi() that uses a structure instead of
the normal huge pile of parameters. Is faster and easier to use.
The call as implemented in the Sozobon C XGemFast libs is called evnx_multi()
but other compilers or programmers who implement it themselves usually use
some other name...

: Yeah, someone should write a MiNT device interface for the thing...

Actually, there is atleast one! In the GEMAR-distribution there is a
tape-XFS. With a small program (tape*) you can "mount" the tape and use
something like...

tar cvf * /dev/mt

Haven't tried it yet, I broke my (Very expencive...) SCSI2-cable when I
recased my Falcon :-(

> and most "modern" compilers also do so... Some systems at my University even
> use 64 bit ints!

It has probably been said already, but I always try to follow the golden
rule for portable code: "Never assume the sizes of data types"

And as to whether an integer should be a particular size, I fall back on
what Kernighan (sp?) and Ritchie said in "The C Programming Language
(Second Edition)" : An integer should fit the natural word size of the
machine. (I've lost my copy of the book, so this quote may be a little
fuzzy).

To me, "natural word size" refers to the ALU (Arithmetic & Logical Unit)
width of the target processor, so an int would be 16-bits on a 16-bit CPU
like the 68k, but 32-bits on a 32-bit CPU like the 020+ CPUs. DEC Alpha
systems would use 64-bits as the "int" size, as that is the size of the
Alpha ALU (and the Alpha can only deal with 64-bit integers - smaller data
has to be loaded, masked, and optionally bit-shifted into the correct form
that the ALU can deal with natively)

(CPU's work fastest when using ALU-width data. Smaller or larger data is
slower to deal with, and more likely to generate errors)

For a 68000 or pre-386 CPU this would mean 16-bit.

For a 68020 or 386+ processor, this would be 32-bit.

But the compiler writer is free to ignore this.

No, I tried to do this but it won't work. The problem might be in
the C's AES library (not re-entrant), but I don't know.

It really pissed me.. you can't fully use that wonderful multitasking
in programs because of that.

Normal AES libaries aren't re-entrant but there's mt_aes library which
claims to be re-entrant. Haven't tried it but if I remember right it is
designed for MagiC's threads. Probably works with MiNT threads also.
Can be found e.g. from ftp.cs.tu-berlin.de.

4730. GFA Basic on a Falcon/T60

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-20 00:00:00 UTC
From: ebaiz@qtm.net
Message-ID: <5eic01ebm1@news2.qtm.net>
Source record: 7479

I have a Hades 060 clone and have tried to run GFA Basic version 3.6.
It runs just fine, but the menu's are all garbled and cannot be read.
I have to run the program in only two colors (mono) to get it to run
properly. How is everyone running this program on a Falcon? Are you
using a 2,4 or 16 color mode or are you using a 256 color mode?

Ahem...
The ALU in the M68000 is 32 bit. Sorry, couldnt resist that!
My point is that it is up to the guy who writes the compiler to decide what
the "natural word size" is. Sometimes its obvious, sometimes it isnt.

No, the Alpha can deal with 32 bit integers in the
ALU *and* the memory. On top of that the latest
generation (EV5) can also load/store bytes.

GFA Basic is pretty hardcoded when it comes to draw it's menus and other
things. I only works in ST modes.
There was a preview of GFA Basic 4.0 with a GEM shell, but apparently, the
company that was in charge of its development never released it.

Unless you want to run in ST compat. modes, the only way to run it is
with the use of a good shell program or to write a little program
that changes your screen mode to an ST compat. mode before
automatically launching GFA.

I use G-Shell for GFA Basic. I believe it has been released as shareware
or perhaps freeware by now.

> The ALU in the M68000 is 32 bit. Sorry, couldnt resist that!

You must have a mutant 68k.

Can I buy it - it'll be worth something someday... {[:-)]

But seriously, the ALU in the 68000 is 16 bit - it can only work with 16
bit data in one pass. The 68000 (and its 16-bit friends [68010, 68331])
is, however, intelligent enough to make two (or more) passes at the data
when 32 bit data is manipulated. An "ADD.L d0,d1" instruction takes two
or more passes through the ALU before completion.

The first 32-bit ALU for the 68k appeared in the 68020.

(I believe this is covered in the comp.sys.m68k FAQ)

4741. GCC 2.7.2 ?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-23 00:00:00 UTC
From: ajalkane@lk-hp-6.hut.fi
Message-ID: <5epdde$uot@nntp.hut.fi>
Source record: 7490

Hi,

I'm trying to get GCC 2.7.2 up and running to use C++.
But the problem is, all I can find is versions of
libraries for it that require 68030 and CoProcessor.
Unfortunately I don't have coprocessor, and anyway I'd
like to do software that works with every Atari.

Anyone know where to find libraries that work with
every Atari?

Thanks,
Arto Jalkanen

Sory, can't resist too.
The ALU of a plain 68k is 16 bit. All ALU operations on longs take 2 clock cycles more then the same on a word. If the 68k had a 32bit ALU there would be no difference.

Bye, Hans

I had to change the menu heights through code to make my programs work
in other resolutions. If you need to see some sample code I can e-mail
some to you.

Also, if you want to use the GET/PUT graphics commands, you will have to
make your own for the higher resolutions. I also have code to do this.

Thanks,

That depends on your definition of `32 bit processor`, but normally the
68000 is indeed considered a 16 bit processor (even though the 68k
architecture is definitely 32 bit). In the 68000, only the registers are 32
bit long, the internal data paths are not.
(In the same way, many 8 bit processors have 16 bit wide registers.)

>a 24-bit address bus? In a similar manner to this 386SuX/16 that is=20
>currently blasting some MODs at me?

The 386SX is very similar to the 68030 as used in the Falcon.
Both are fully 32 bit internally, but have a 16 bit data bus to the outside
world.
While the 68030 _can_ use a 32 bit bus, it's locked to a 16 bit one in
the Falcon.

Mark Baines wrote:
>
> Is the MiNT function Dpathconf() available on any other OS, such as MagiC, or
> is it MultiTOS only?

MagiC supports almost all the MiNT function calls (as of V5). Even V4
supported
quite a lot of them, and Dpathconf() was among them.

> In other words, can you have a drive U:? I see from someone with MagiCPC that
> there is a U: drive but is it like MiNT's U:?
> Does Pdomain(), Dopendir(), Dreaddir() mean anything under MagiC?

Pdomain() just causes MagiC's file selector (and any loadable
filesystems
present) to assume that the program understands long filenames (this is
a V5
feature). Dopendir()/Dreaddir() work fine as of V4.

Hi All!

First some bad news. KillThings (Doom clone) is no longer being
developed by DigiTallis (Boo hoo! :(

Some Good news. The source code and executables are now on the
DigiTallis Web site as PD! :)

I have down loaded it and I think I might be able to finish the
coding! (Just got to define a level file spec, put in level loading routs, add
game logic, finish off the level editor, etc, etc. A big job, but once I
define the level specs, then It should be a lot easier. Tell you what though,
perhaps some other programmers out there would like to lend a hand? If we
can define a common level file format, then we can all work together to get
the game finished!)

Yeah!

Bye for now!

Brian!

In a attempt to kill the dread BUS ERROR (2 bombs) I am thinking about
a method to intercept exception vector 2 and replace it with my
routine that just ignores the exception. I tried signal()s, but they
won't catch it.

Setexc(2, (void (*)())-1) will read the current vector.
Setexc(2, trap_ex) should set it to function trap_ex()

and of course, reset it before I return.

Question:

```
void __interrupt trap_ex()
{
} will this work?
```

or:

```
void trap_ex()
{
_emit( RTE );
}
```

or should I just suffer with the BUS ERRORS?

This is almost certainly the case, since virtually all GEM libraries
used by compilers use global arrays for the AES contrl[], intin[],
intout[], addrin[], addrout[] and global[] arrays.

The only way to fix it is to either protect AES calls with an
interlock mechanism (i.e. a semaphore), or to fix them so that
they use local arrays.

Get the book Modern Atari System Software, or The Atari Compendium.
Alternatively, get the osbind.h and xbios.h etc. from an up-to-date
C compiler for the prototypes...

Also, check out my WWW pages, as I have information on how you use
some of the new calls...

>Is there any free DSP 56000 compiler available?

Yes, Micro C and GCC have both been ported to generate 56000 code.
(sorry, I dont know where you can get either compiler on the net)
However, according to Doug Little, a C compiler will generate far
from optimal 56k code, and it would often be better just to use the
680x0 (but this is not the case with hand-written 56k code).

The Atari Compendium would be a good start (as usuall...). It covers about
everything and all AES calls up to AES 4.1 (which is the latest) including
xbios and some DSP stuff.

> Is there any free DSP 56000 compiler available?

I think Motorolas DSP assembler is for free (and the best I think), or?

It's quite simple; you have, presumably, filled the text string with
"_" characters. This is not necessary. All you have to do is start
with the p_text field blank (i.e. wherever you put "_", delete them).
The p_tmplt field should contain (in WERCS and all other RCSs that
I've seen) "Host:~~~~~~~~~~" (as many "~" as you need). The other
field should have "x"s (as many as you have "~") and nothing else.
(I may have got the p_tmplt and the other field mixed-up; in any
case I can't remember the name of the second one).

The font header is the same as the one in Lattice C's "linea.h" header
file.
It is exactly the same thing.

Yes. Convert the file into hex codes; then (if you want to use the
line-A) to
plot the font, you'll have to mess with the textblt function. It's very
gory
and really quite awkward. Instead, I suggest you load the font from
ASSIGN.SYS.
(And use GDOS).

> that are ignored and obliterated once the init() code is finished...

work_in[] is an array containing the default attributes for each of
the drawing functions (e.g. colour, size, etc...). I don't recall which
way round they go (but you should be able to test this easily enough).

work_out[] is a 57 element array (normally), which gives you information
about the particular display device you have chosen to draw upon. Again,
I don't remember all the elements... but you should get a Compendium or
something to look them up in.

4760. Re: GDOS drivers

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-25 00:00:00 UTC
From: Thomas_Much@ka2.maus.de
Message-ID: <199702252232.a40486@ka2.maus.de>
Source record: 7360

MB>is there another, simpler way I can find out what GDOS drivers are
MB>available to the system?

There are two VDI calls, both are supported from NVDI 3.00 onwards.
vq_devinfo() is also available in SpeedoGDOS IMHO, but the use of
vq_ext_devinfo() is recommended.

------------------------------schnipp------------------------------

• INQUIRE DEVICE STATUS INFORMATION (VDI 248)

vq_devinfo() returns if a driver is available and if it has been opened
already. The file name (e.g. "XVGA256.SYS") and the full name ("VGA 256
colors") are returned, too. If the file name is empty, the driver is
not available.

Decl.: void vq_devinfo(WORD handle, WORD device, WORD *dev_open,
BYTE *file_name, BYTE *device_name);
Call: vq_devinfo(handle, device, &dev_open, file_name, device_name);

Input:

contrl[0] 248 vq_devinfo
contrl[1] 0 # ptsin
contrl[3] 1 # intin
contrl[6] handle
intin[0] device VDI device (0-99)

Output:

contrl[2] p # WORDS in ptsout
contrl[4] i # words in intout

ptsout[0] dev_open 0: driver has not been opened yet
1: driver has already been opened
ptsout[1..p-1] device_name driver's full name (C string)
intout[0..i-1] file_name driver's file name

Annotations:
The file name is returned word by word, i.e. for each letter one word
is used (control[4] returns the length of the string). The full name
is returned as a ASCIIZ string (control[2] returns the number of
WORDS in ptsout).

------------------------------schnipp------------------------------

• INQUIRE EXTENDED DEVICE STATUS INFORMATION (VDI 248, 4242)

Like vq_devinfo() vq_ext_devinfo() returns the driver names and
information. Unlike, the data format makes more sense.

Decl.: WORD vq_ext_devinfo(WORD handle, WORD device, WORD *dev_exists,
BYTE *file_path, BYTE *file_name, BYTE *name);

Call: dev_open = vq_ext_devinfo(handle, device, &dev_exists, file_path,
file_name, name);

Input:

contrl[0] 248 vq_devinfo
contrl[1] 0 # ptsin
contrl[3] 7 # intin
contrl[5] 4242 subopcode
contrl[6] handle
intin[0] device VDI device (0-99)
intin[1/2] file_path pointer to file path buffer
intin[3/4] file_name pointer to file name buffer
intin[5/6] name pointer to full name buffer

Output:

contrl[2] 0 # ptsout
contrl[4] 2 # intout
intout[0] dev_exists 0: no driver with this device number
!= 0: driver exists
intout[1]: dev_open 0: driver has not been opened yet
!= 0: driver has already been opened

All returned strings are C-like ASCIIZ string.

--------------------------------schnipp--------------------------------

bye, Thomas

I believe MiNTNet has a driver for that card, so you should be able to use
CAB with it via MiNTNet.

4762. DLLs for Atari?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-26 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <21a7cd$14363a.37a@HERMES>
Source record: 7362

Has anyone ever seen any DLLs for the Atari?

Or know of any programs that use them?

I have been working on a TSR that allows the loading of modules and "DLL"
like extensions or plug-ins. It will be released later this year, and will
be freely distributable (within reason).

(More details will be forthcoming - I am still debugging the Load/Free
funcs, as well as make it somewhat more "intelligent")

> the Falcon.

Footnote to the above:

The 030 has a 32-bit CPU-to-world data path. The 386SX is only 16 bit in
this regard (the 386DX is a full 32/32 CPU like the 030).

The '020 and '030 have a feature called "Dynamic Bus Sizing" whereby the
CPU detects the bus size on each access. It can be used on either a 16 or
32 bit system board. A 16-bit system board (like that in the Falcon) is
slower than a same speed 32 bit system board (like that in the TT)

The '040 removed this feature. It can be added, however, by the addition
of an external Motorola 68xxx chip - I forget the chip number, but it's
mentioned in the comp.sys.m68k FAQ.

Ok, If I could find the problems, I could fix them. But I get cryptic
messages that say "I got 2 bombs" and I have no idea where the problem
is. I need a method to detect and report the BUS Error so that I can
fix it!

More Ideas?

Get Templemon. It's free and should be available on the normal FTP sites.
(It may be abbreviated TEMPLMON.)

It sounds like your programming language has its own bomb handler, so you
may have to do this:

1. Run your program.
2. Press Control-Help (to get into Templemon)
3. Type "vi" to reinitialize Templemon's vectors.
4. Type "g" to Go back to your program.
5. Make it crash. You should end up back in Templemon.

Of course, now you'll need to know assembly language to actually figure
out where the error is...

A few. ;-)

Imo low level debugging is not much use. Just because your program crashes at a particular point does not mean that point was at fault, or under multitasking that your program is even at fault at all! Thus I prefer to incorporate debugging into the program itself.

Leave in the all debugging information just in case the report comes from someone who happens to be proficient in the same language. Rare but useful.

As we all know many (most?) problems are down to memory leaks so it is well worth writing your own memory manager so you can implement decent checking. It could then output a suitable alert and dump that and the "arena" to disk before continuing onto the crash. The more checking the better. There's nothing stopping you storing function names in your custom block headers if you wanted. ;-)

Logging entry and exit from functions is another useful method but you must ensure the data gets written. I method I have used is loosely based on the below. More intelligence is needed of course but this serves to illustrate ...

```
debug(r)
char **r;
{FILE *fp;

if (!(fp = fopen("LOGGING",APPEND_ONLY_IF_EXISTS_MODE))) {
/* logging disabled */
return;
}
fprintf(fp,"%r",&r);
fclose(fp);
}
```

.. which is going to be damn slow when enabled of course!
[I'm not sure if recursive printing is MWC specific or not]

As an aside, I thought telling people how to create a zero length "LOGGING" file to enable the logging would be easy but sometimes it was not, so supply a little program to do it for them! <G>

4770. Using 'C' in GFA Basic

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-27 00:00:00 UTC
From: houghp6@cs.man.ac.uk
Message-ID: <5f415h$cke@m1.cs.man.ac.uk>
Source record: 7370

I'm interested in using some C stuff in GFA. I;ve looked at one exa,ple program,
and its not clear quite how it works.

This is what I've gathered so far:

place the .o file of the C you want to use in the system folder before compile,
you can then call the C procedure by using $X proc name.

what I'm not sure about is how I can pass parameters back and forth, and also
how this works in interpreter mode.

Does anyone have any example progs (both C and GFA) explaining how to use it
etc. ???

If so can they mail me a reply ??? (houghp6@cs.man.ac.uk) or reply here.

Thanks

Phil Hough

4771. Any books, tutorials, etc. on GEM for BASIC people?

Newsgroup: comp.sys.atari.programmer
Date: 1997-02-27 00:00:00 UTC
From: Robert Aries <robaries@ix.netcom.com>
Message-ID: <3315A255.20C6@ix.netcom.com>
Source record: 7371

I've been using GFA Basic for many years and have done some pretty big-scale (to me, anyway!) projects with it. I'm a musician and have mostly written programs to help me get more from my gear.

My latest project is to help me use my Roland XP-50 keyboard, and it requires me doing something I've never done before, in all my years of programming--a dialog box! I've always used GFA's own keywords & commands to take care of system calls, and they don't have a specific DIALOG command similar to ALERT (for an alert box).

Anyway, I'm completely self-taught and have gotten a lot of help from many people over the years when I needed it. I have a book on TOS and have gotten into things that I needed to, like re-sizing the midi buffer, messing with disk files, etc. However, I've never had to write my own AES, VDI, or higher-level GEM routines because I've been able to accomplish those things with GFA's own commands. Do you see the problem? I am completely lost when I try to get into these areas because all the books & tutorials I've seen assume knowledge of C, assembler, and microprocessor workings. GFA shields me from all that (like a good BASIC should, I suppose!), so I never learned what is going on at the nuts & bolts level.

I have Tim Oren's old PROGEM series, and the Atari Compendium. Re dialogs, I understand the basic concept of parent-child object trees but get lost when trying to figure out the syntax--how to put together the TEDINFO, etc. stuff and make it work in my program. The example files that came with GFA 3.5 don't help me much. I would like to know if there is any reference material that would help someone like me who is not new to programming in general (ie, I have the capacity to understand some advanced topics) but need to start from the point *before* someone already experienced in C and assembler. I have searched the web and not found much...any help is appreciated. Thanks!

Rob Aries

Source record: 7374

: >Fix your programs. Bus errors are the result of bugs.

: Ok, If I could find the problems, I could fix them....[snip]

Definitely fix your programs -- bus errors are caused by attempting to
access (read or write) memory you are not allowed to. For example, attempting
to access an OS variable without being in supervisor state. Reading or writing
outside of the total mapped memory, or attempting to write to ROM areas.

: More Ideas?

One way to try and catch the point where is bombs out is to use MiNT with
memory protection on. This will distinguish between reading/writing to memory
like OS variables (bus error) and just accessing memory outside of your
program (perhaps accidentally reading/writing after then end of an array,
particularly if that array was createde with Malloc().

MiNT should give you a message telling you the type of the error (bus/address
etc) and the point in your program where it happened. The trick then is to
figure out the point in your program exactly -- if you are writing in assembly
then this is a doddle, but anything else is a bigger problem.

Hope some of this is of some help.

Cheers,

James Cox.

Shared libraries are really only useful in a multitasking environment,
otherwise only a single process would ever use them at a time anyway.
Of course there are benefits of being able to fix bugs without re-linking
the executable.

You may want to look at MiNT--it may have support for shared libs.

Also, shared libs, if not implemented correctly, may cause problems in
a multitasking environment with memory protection between processes.
Generally, shared lib code will reside in "shared, read-only executable"
memory space.

Yes, of course. Andreas has written a reentrant AES library for MagiC.
If you run MagiC, you can download it from the ASH BBS.

Cheers Peter

Try to set the first character of the tedinfo te_ptext field to a '@' :

tree[index].ob_spec.tedinfo->te_ptext[0] = '@';

With STiK 2 you'll be able to use a Ethernet module that provides
Ethernet connectivity for STiK. However, it's not ready yet ... ;-)

>programming--a dialog box! I've always used GFA's own keywords &
>commands to take care of system calls, and they don't have a specific
>DIALOG command similar to ALERT (for an alert box).

Get hold of a resource editor. You just place the "OBJECTS" where you
want them and it builds it for you (the .rsc file). Don't do it by
hand. I've been doing them for years and still screw it up if I have
to do one manually! Plus, manual ones are a real pita to change.

Can somebody recommend a shareware editor?

The only resource editor (I know of) which generates GFA is Interface
which is commercial. Don't let that worry you though. It is easy to
convert the C header file (the .h one the editor writes) into (I guess)
an .lst file. Certainly infinitely easier than doing the whole lot
manually anyway!

>Anyway, I'm completely self-taught and have gotten a lot of help from
>many people over the years when I needed it. I have a book on TOS and
>have gotten into things that I needed to, like re-sizing the midi
>buffer, messing with disk files, etc. However, I've never had to write
>my own AES, VDI, or higher-level GEM routines because I've been able to
>accomplish those things with GFA's own commands.

Another advantage to using a resource file is that it has the
potential to be resolution independant. The rsrc_load() function does
the conversion for you.

>Do you see the problem? I am completely lost when I try to get into these areas
>because all the books & tutorials I've seen assume knowledge of C,
>assembler, and microprocessor workings.

Assuming you use a rsc editor and that GFA has such commands as
rsrc_load() etc then most of your subsequent problems will revolve
round accessing the relevent bits of data in the resource.

A rsc is built from OBJECTs and array of OBJECTs make up a TREE. One
of the things a TREE can be is a dialogue box.

No doubt you'll have come across something like this already ...

```
typedef struct object
{
int ob_next; /* -> object's next sibling */
int ob_head; /* -> head of object's children */
int ob_tail; /* -> tail of object's children */
unsigned int ob_type; /* type of object- BOX, CHAR,...*/
unsigned int ob_flags; /* flags */
unsigned int ob_state; /* state- SELECTED, OPEN, ... */
unsigned long ob_spec; /* "out"- -> anything else */
int ob_x; /* upper left corner of object */
int ob_y; /* upper left corner of object */
int ob_width; /* width of obj */
int ob_height; /* height of obj */
} OBJECT;
```

It translates thus ...

```
Decimal offset Name
-------------- ----
00 ob_next
02 ob_head
04 ob_tail
06 ob_type
08 ob_flags
10 ob_state
12 ob_spec
16 ob_x
18 ob_y
20 ob_width
22 ob_height
```

So, if you had a variable P then to read the value of ob_x you would
need to get 2 bytes from p+16 - something like PEEKWORD(p+16) I suppose.
ob_spec is the only 4 byte value and is used differently depending on
the OBJECT's type (ob_type).

The OBJECT structure is always 24 bytes long as you can see, and
because a TREE consists of an array of these then you need to be able
to access the correct array element. In C you are not limited to
having arrays of strings or integers - you can make up your own
things, so when you see ...

```
OBJECT P[10];
```

.. you have declared 10 lots of 24 bytes, and when you see this P[3]
written in C, it is the same as saying P+(24*3). Combine this with the
ob_x part above then P[3].ob_x in C translates to P+(24*3)+16. Thus
for any C array reference to a structure ...

P 24 3 16
mem_location = base_address + structure_size * array_element + offset

Just write some functions to do this sort of thing for you 'cos the
potential for errors is enormous!

>GFA shields me from all that (like a good BASIC should, I suppose!),
>so I never learned what is going on at the nuts & bolts level.

A dialog box consists of a ROOT OBJECT which is covered by CHILDren.
The ROOT OBJECT is always in the array at element 0. The CHILDren
reside in other elements in no particular order (the ob_next, ob_tail,
ob_head items define their relationships). The resource editor does
this for you, you'll be pleased to hear. This is where the C header
file (.h) comes in. It allows you to name any OBJECT you want to mess
with. When you save, it assigns the correct array index values to the
names so that you can access the OBJECT you want. Note - each time you
save in the editor, these values can and will change so never put
fixed values in your program - always use the names.

The C header will look something like this ...

```
#define F0 0 /* TREE in Resource {filename} */
#define F0OK 7 /* OBJECT in TREE F0 */
#define F0CANCEL 3 /* OBJECT in TREE F0 */
```

This needs to be translated into something like this ...

```
LET F0 = 0
LET F0OK = 7
LET F0CANCEL = 3
```

.. it's that simple!

So your program would like something like this ...

```
R_TREE = erm_dunno_offhand
ROOT = 0
MAX_DEPTH = 8

RSRC_LOAD("eg.rsc")
RSRC_GADDR(R_TREE,F0,&P)
FORM_CENTER(P,&X,&Y,&W,&H)
FORM_DIAL(0,1,1,1,1,X,Y,W,H)
OBJC_DRAW(P,ROOT,MAX_DEPTH,X,Y,W,H)
RESULT = FORM_DO(P,0)
FORM_DIAL(3,1,1,1,1,X,Y,W,H)
RSRC_FREE()
```

.. where P is a 32 bit value so it can hold the TREE (ie the base
address of the OBJECT array). R_TREE, ROOT and MAX_DEPTH are constants
commonly defined when using Gem. Where I've used the & above you need
to find some way of passing the address of the variable rather than
the variable itself, so that the functions can fill those variables
with the correct values. The above does nothing except display and get

rid of the dialog to keep it simple.

>I have Tim Oren's old PROGEM series, and the Atari Compendium. Re
>dialogs, I understand the basic concept of parent-child object trees but
>get lost when trying to figure out the syntax--how to put together the
>TEDINFO, etc. stuff and make it work in my program.

TEDINFO is one of those things which is slung onto the side of an
OBJECT. This is the sort of thing that ob_spec is used for.

```
typedef struct text_edinfo
{
unsigned char * te_ptext; /* ptr to text (must be 1st) */
unsigned char * te_ptmplt; /* ptr to template */
unsigned char * te_pvalid; /* ptr to validation chrs. */
int te_font; /* font */
int te_junk1; /* junk word */
int te_just; /* justification- left, right...*/
int te_color; /* color information word */
int te_junk2; /* junk word */
int te_thickness; /* border thickness */
int te_txtlen; /* length of text string */
int te_tmplen; /* length of template string */
} TEDINFO;
```

```
Dec offset
----------
00 te_ptext
04 te_ptmplt
08 te_pvalid
12 te_font
14 te_junk1
16 te_just
18 te_color
20 te_junk2
22 te_thickness
24 te_txtlen
26 te_tmplen
```

If there was a TEDINFO in the OBJECT named F0EDIT then it is accessed
thus ...

```
T = PEEKLONG(P+(F0EDIT*24)+12)
```

. then you could manipulate it ...

```
S = PEEKLONG(T+8)
```

.. which leaves S pointing at the nul terminated te_valid string.

> The example files that came with GFA 3.5 don't help me much.

There is a utility called MYDIALS for GFA which I think places whole
dialogs into windows. Although this is more than you want it might

have some tools or sources which will help you figure out how to translate all the C examples into basic.

>I would like to know if there is any reference material that would
>help someone like me who is not new to programming in general (ie, I
>have the capacity to understand some advanced topics) but need to

Try initializing the string tedinfo->te_ptext points to. So, if you
have

string[number];

initialize it with

string[number]="";

or

string[number];
string[0]='\0';
```

Yes, but I don't think you should look at the above as shared libraries
in the normal sense. DLL, after all, stands for Demand Loaded Library.
That is, a library that is only loaded when it's needed. It doesn't
necessarily have to be sharable by definition.

IMO this would be a generalized way of dealing with for example load/save
modules in image or word processing programs.
If it's released soon enough, I'll definitely consider using it for the
module system that will go into the next version of MGIF. Otherwise I'd
have to write something similar myself.

>Of course there are benefits of being able to fix bugs without re-linking
>the executable.

Perhaps, but for that to be really useful your executable would, IMHO, need
to be partitioned into relatively small 'library chunks'.
It's after all not that often that serious bugs are found in the standard
libraries themselves.

as spake by atwareck@novice.uwaterloo.ca (Art Twarecki) :

>You may want to look at MiNT--it may have support for shared libs.

Unfortunately not. That's one of the things that gets suggested about
every six months or so on the MiNT mailing list; usually, it gets as far
as determining that it will require modification to the compiler to
generate the shared library and stub calls thereto before petering out.

4788. Editable Objects

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-02 00:00:00 UTC
From: david@ritter.demon.co.uk
Message-ID: <44964885_000008_OASIS_NEWS@ritter.demon.co.uk>
Source record: 7388

I'm currently writing a replacement form_do() so that I can
use non-modal dialog boxes.

I am having a little problem with editable fields though.

My routine works fine if all the editable fields are either: in one
child object, in one child and the root object, or if they are all
in the root object.

The problem arises when I have editable fields in two seperate
child objects. When I try to move the cursor between the two
child objects it crashes on me.

My cursor routines add or subtract 1 from the object number, check
to see if the editable flag is set on this object, if it is then
I place the cursor in to the object otherwise I continue adding or
subtracting 1 from the object number until all the objects have
been checked.

Can anyone help?

(And before anyone says to just use a C library that already supports
non-modal dialog boxes I'm writing in assembly language)

a TSR approach to this under MiNT is a _bad_ move. Causes all sorts of
problems. Also, you can't load and unload modules on the fly. Fine if you
intending this to be used for SingleTOS without MiNT (TOS in ROM, basically),
but if you want this to work with MiNT then you'll need a big redesign.

: Shared libraries are really only useful in a multitasking environment,
: otherwise only a single process would ever use them at a time anyway.
: Of course there are benefits of being able to fix bugs without re-linking
: the executable.

: You may want to look at MiNT--it may have support for shared libs.

It doesn't as far as I know.

: Also, shared libs, if not implemented correctly, may cause problems in
: a multitasking environment with memory protection between processes.

Exactly.

: Generally, shared lib code will reside in "shared, read-only executable"
: memory space.

I would argue that a shared library/module/whatever who _always_ be in shared,
read-only memory. Anything that the module wants to be able to change should
always belong to the client application.

Incidentally, I am working on a Component Manager for MiNT (and only MiNT --
it won't work without multitasking support). I have no idea when it will be
finished, but I'm hoping that I will have a little time in about 13 weeks
(when I finish my degree -- wayhay!! :). It's all designed, and partially
coded -- I just need time to sit and code the rest.

Cheers,

James Cox.

4792. GFA 3.5 / TSR's

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-03 00:00:00 UTC
From: mazzeri@foxvalley.net
Message-ID: <mazzeri-0303972031140001@ttyc6.foxvalley.net>
Source record: 7297

Help... ;)

I need help writting (a little) a GFA basic TSR...

I know what to do for most of it, but I need help on some weirder concepts...

If you CAN help me PLEASE email me so I know to come back to this newsgroup...

I am going to write a small auto folder .PRG that will install itself to run when the interrupt for MIDI IN port is generated... What I need this program to BASICly do is...

act as a MIDI THRU when I'm NOT running my music software.... In other words when I'm online w/ the computer and I wanna play my midi rig it'll be waiting in the background for MIDI port input... then it'll grab that vector and take the byte that's in the MIDI IN port and send it to the out unchanged... It's a TSR... I don't want an ACC...
Also I'd like a hot key combo to make it go DORMANT (set vector back to normal) and watch they keyboard for the hotkey combo again to come back to ACTIVE...

I need to know if it's is possible to READ the MIDI in port WITHOUT clearing the byte read? So that after I run my THRU routine I can branch back to the system's routine... Or would it be more wise to just use my own routine all together?

Also in GFA manuals it CLAIMS that you can NOT use pterm resident... Is this due to the effect that it woud have on the interpreter? I mean if I wrote the program WITH the pterm res call in it... and did NOT run it from WITHIN the Intrpreter, but compiled it instead... Would it work then? or do you know if the compiler would filter out the pterm res command when it did it's thingy?

Also I need clarification on the whole cookie thingy... The one in the basepage... Do I set that when I install my prog? And it's 8 bytes right? 4 for ident and 4 for address right? and the first four are for WHAT? and the second four is WHAT address? The original address that the vector I robbed points to? If my prog were to crash would TOS take that address and poke it back into the vector I robbed?

(here I catch my breath...)

Thanks,

Luke.

Does this include info on how to write your own drivers?

I was thinking it would be nice to write an HPLJ driver which lets
you set the resolution and paper type via the extendable control
panel (puts a structure address for these parameters in a cookie).
Right now you need a different driver for each resolution & paper
type.

form_keybd() takes care of all that. This is how I do it ("start"
is the index of the object being editted):

if(flags & MU_KEYBD) {
key = event.ev_mkreturn;
wind_update(BEG_UPDATE);
if(!form_keybd(tree, start, 1, key, &obj, &new)) {
if(start) objc_edit(tree, start, 0, &cursor, ED_END);
wind_update(END_UPDATE);
return(obj);
}
if(obj) {
if(!new) {
objc_edit(tree, start, 0, &cursor, ED_END);
objc_edit(tree, obj, 0, &cursor, ED_INIT);
start = obj;
}
else objc_edit(tree, start, new, &cursor, ED_CHAR);
}

4795. Eureka a graph describer and 3D modeler

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-03 00:00:00 UTC
From: lecoat@chronos.ief-paris-sud.fr
Message-ID: <5feh8c$kaq@upsn6.u-psud.fr>
Source record: 7300
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since recent revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platforms such as Mathematica or Matlab. It has been
tested with success on MAGIC, TOS2WIN, STonX and MAGIC MAC/PC.
There may be remaining incompatibilities that I wish users to
tell me about. So don't hesitate to mail me ...
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcome ...
Have fun with my production, bye for now ...

Hi all,
I need to get hold of an assembler and a disassembler for use on my Atari STE 2meg Tos. Does anyone know of a shareware one that I can download from somewhere. Also it would help a lot if there was some sort of manual available. Thanks.

Dan Jones.

Or, if you are MS-brained, DLL = "Dynamic(ally) Loaded Library".

Either way, it amounts to (almost) the same thing.

> IMO this would be a generalized way of dealing with for example load/save
> modules in image or word processing programs.
> If it's released soon enough, I'll definitely consider using it for the
> module system that will go into the next version of MGIF. Otherwise I'd
> have to write something similar myself.

My TSR is called "The Toolbox", and I've been working on it since 1992.
It became extensible in 1994, and the ability to dynamically load a module
was added quite recently (previously all modules could only be loaded at
boot time).

It was originally designed as an OS-level library of callable code,
then it became a library manager.

It was all written in assembly language, using Devpac 1.25 (from an ST
User cover disc) and now Devpac 3.1 (from Hisoft)

At present, there are some bookkeeping problems with using it in a
multitasking environment (primarily when multiple apps are using one
dynamically loaded extension). It works OK under MTOS with memory
protection.

It requires TOS 1.0 or better, and about 32k of RAM. It works best when
loaded before MiNT, and was designed for the GEMDOS file system, although
it works moderately well when using minix file system under Mint.

I've designed it to have only one instance of any particular extension (based upon a "cookie" identifier within the extensions ID block).

I'm torturing the current version - as well as mulling over the exact format of the extension/toolbox interface. The "calling the extension" is fully working, but the extension ID block needs work.

There is a built-in limit of 16 extensions loaded simultaneously - but this limit will be raised soon.

It lacks RPC functionality, though. I'd like to add that later.

It still has an assembler level interface in terms of the startup code, and I haven't tried to make it "Lattice Friendly", so you can write extensions in a higher level code (you'd need to make a few changes to the startup stubs and initialisation code, as well as setting the base register [generally A4] on entry to any funcs that needed it when using a base-relative compiler mode).

If you are interested in taking this further, I'll start a "Toolbox API" thread in c.s.a.p and we can nut out the details to form an "open" standard calling protocol.

Source record: 7393

I am just learning how to program the Atari 400/800 in assembly and would like to get a few examples of assembly programs for the Atari 400/800. I work best from examples. If anyone would be willing to share a program or two it would be most helpful.

Thanks for any help on this

Tom

Hmm, if you always place the cursor in an editable field I can't see why
it would crash. Unless you put it there in the wrong way of course.

>Can anyone help?
>
>(And before anyone says to just use a C library that already supports
>non-modal dialog boxes I'm writing in assembly language)

There's nothing stopping you from using C libraries from assembler (if
you use a decent assembler), but I know it can be interesting to write your
own stuff from the ground up.
Still, writing GEM code in assembly doesn't sound like much fun at all.

Anyway, I actually modified the MGIF sources for windowed dialogs a couple
of days ago and extended that to handle any number of open dialogs
simultaneously only yesterday.
For the edit field things I simply used form_keybd(), which worked very
well for the single windowed dialogs (incredibly simple to do). There are
still some strange problems remaining with the multi-dialog version,
though, so I'm not 100% sure that form_keybd() actually does the job...
(There are lots of other strange things going on in the extended code, so
form_keybd() may well be blameless.)

Perhaps there's someone around who has more experience with form_keybd()?

Tricky blighters are editable fields. :-)

>My routine works fine if all the editable fields are either: in one
>child object, in one child and the root object, or if they are all
>in the root object.
>
>The problem arises when I have editable fields in two seperate
>child objects. When I try to move the cursor between the two
>child objects it crashes on me.

Check out objc_edit() carefully. There are two bindings for it and I'm
not sure offhand which is the "real" one.

objc_edit(tree,object,character,oldindex,kind,newindex)
objc_edit(tree,object,character,&index,kind)

. where &index does double duty (oldindex in - newindex out).

There are some instances where an incorrect LASTOB will cause Gem to
barf (anywhere in the wrong place can make it sulk basically).

With that sorted, you use ED_INIT to start a text field, ED_CHAR
within it, and ED_END to finish off the field. So to move fields you
need an ED_END(cur_field) then ED_INIT(new_field).

>My cursor routines add or subtract 1 from the object number, check
>to see if the editable flag is set on this object, if it is then
>I place the cursor in to the object otherwise I continue adding or
>subtracting 1 from the object number until all the objects have
>been checked.

There are two concerns with this method, both are derived from the
fact no consideration is given to the real order in which the objects
in the tree occur. This has implications both for the LASTOB flag
(which you are effectively ignoring) and which field the cursor
appears in when you "tab" to the next one (which could differ between
Gem and your routine). For a one-off situation this is acceptable as
you can massage the resource editor into producing the order you want
but not otherwise.

>Can anyone help?

You need to walk the tree like Gem. Gem does a recursive descent until it meets LASTOB (end of tree) or returns to the ROOT. A handy function to implement is one which does something like this ...

Objc_Walk(tree,startob,func)

. which descends 'tree' from 'startob' repeatedly calling 'func' until it rises back to 'startob' or 'func' aborts the traversal. 'startob' is typically set to ROOT but this code can be used for lots of things if 'func' is passed 'tree' and the index of the current object - like manipulating radio buttons for instance (ie - set 'startob' to the parent of the buttons, func unselects them .. blah).

>(And before anyone says to just use a C library that already supports >non-modal dialog boxes I'm writing in assembly language)

Most C libraries behave like traps. You should only have to preserve d3-d7 and a3-a6 to make a call work, but it's more fun doing it yourself!

I would not recommend MASS; it's just the bits they missed out of the
lattice C documentation, The Compendium has it integrated with the existing
calls, and also has much more detail on everything.

>>Is there any free DSP 56000 compiler available?
>
> Yes, Micro C and GCC have both been ported to generate 56000 code.

> 680x0 (but this is not the case with hand-written 56k code).

Yes, it's very difficult for a C compiler to use things like circular
buffers or hardware looping efficiently. Many DSP vendors sell compilers
that use a C-like language with extra features for efficient DSP use; there
was some talk of standardising them but at the moment all such compilers
are different, and in any case none of them are freeware or available at
all for the Atari.

>
> Are you sure? The MWC editor uses '@' ?

He's right about the ~; where the @ is used is to clear the text field - you
fill it with enough spaces (or anything else for that matter) and then go
back and replace the first one with a @.

-(10,000 pictures of beautiful hot sexy Celebrities CD-ROM - ME#3)-
Questions? CALL US! The number is listed on our website:
http://www.nude-celebs.com

Just SOME of the features-ME3 CDROM:

600+ pictures of Cindy Crawford
400+ pics of Pamela Anderson
250+ pics of Elle Macpherson
200+ pics of Christina Applegate
200+ pics of Alicia Silverstone -==< 10,000 CELEBRITIES!! >==-
200+ pics of Mariah Carey
200+ pics of Sandra Bullock
150+ pics of Liv Tyler, young star (Web Masters get a FREE CD!)
130+ pics of Niki Taylor
130+ pics of Kate Moss!!! For a list of ALL files on the CD
100+ pics of Madchen Amick goto www.nude-celebs.com
100+ pics of Racquel Darrian - *WOW*
80+ pics of hot model Jenny McCarthy! (Nudity!)
80+ pics of Paulina Poriskova, sexy supermodel!
70+ pics of Bridget Hall, supermodel!
50+ pics of TRACI LORDS, yes! ***6 Celeb CDs in One!***
50+ pics of Daisy Fuentes, hot spanish VJ
50+ pics of Salma Hayek, sexy latina actress! ORDER LINE!
50+ pics of Teri Hatcher 1-757-484-7538
* 4000+ pics of other NUDE stars
* 4000+ pics of PG-13 rated celebrity poses
* 10,000+ pictures total, thats TEN thousand!
* Graphics viewing software for Windows3.1/DOS/Win95
* CD is BBS ready, with descriptions of files! And its Mac readable!
* Many more features and pictures of stars!
* NO AMATURE MODELS! - ONLY Celebs!

This CD represents high quality work. Here is the pricing:
$$$ $34 each (plus $2 shipping, $5 shipping outside USA) $$$
ADULT WEBMASTERS - Get this CD for FREE! Goto our site, find out how!

(For MORE information on content goto http://www.nude-celebs.com/

I use form_keybd() in my GEM library in the way you mention (with multiple windowed dialogues) and it works without any problems. Strangely, it worked perfectly first-time and I've never had any problems.

So it definitely is possible. It also a better way to do it since you still get the advantages of things like Let 'em Fly. If you write your own form_keybd, such advantages are lost.

The 68k has a 32-bit ALU and 32-bit registers. It is, in fact, a 32-bit
processor; it just has a 16-bit bus to make the external circuitry cheaper.
In this respect it is equivalent to the 386SX.

The natural word size, then, is of course 32 bits. I don't know why most
Atari C compilers default to 16 bit ints.

JK>Does this include info on how to write your own drivers?

No.

JK>I was thinking it would be nice to write an HPLJ driver which lets you
JK>set the resolution and paper type via the extendable control
JK>panel (puts a structure address for these parameters in a cookie).

The NVDI CPX lets you set these attributes. Why do you want to
use a cookie?

JK>Right now you need a different driver for each resolution & paper type.

There is a message PRN_CHANGED which is sent from the NVDI driver CPX
to all running applications whenever the user changes the driver
settings.

And you should take a look at the German NVDI programmer's guide.
The system extension WDIALOG provides a complete printing dialog.
If you use these routines you won't need the driver CPX any more.

bye, Thomas

Yes please. I have something on AV but it looks incomplete.

In case anyone is wondering, all I want to do it bring Ease to the top
on bootup (under MagiC). It's annoying having to ALT-CTRL-TAB it to
the top so I can get at my keyboard shortcuts!

That's because the 68000 has a 16 bit ALU. Working with 16 bit integers is faster, usually 2 clock cycles unless it's an register to register operation, then it takes 4 extra clockcyles. Secondly using 16 bit ints is faster because of the 16 bit bus.

When you use a 680x0 "move.w" (move word) instruction, it deals with 16 bits.

Considering that the 680x0 has instruction sizes for byte, world and long,
and C uses char, int, and long, these correspond pretty well IMHO. If you
went to 32-bit ints, that would mean sizeof(int)==sizeof(long), which is
not as flexible. There would be no way to specify a data type 16 bits wide
without using a union or struct.

Eh? What's wrong with 'short'? (or 'short int'?)

Lattice C, for instance, has the basic types char, short and long,
and 'int' is either 'short int' or 'long int' depending on the compiler
options. Thus you can set the exact size if necessary, and just use 'int'
if it doesn't matter.

4820. 32 bit ints

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-06 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <900_9703061235@conchbbs.com>
Source record: 7320

Regarding the "natural" word size, I might add that the 68030 still
requires instructions and the stack pointer to be aligned to word
(16 bit) boundaries, and that nothing is required to be aligned to
long boundaries (except the video RAM, but that's another chip).

I only use "int" for two reasons:

1) It's easier to type than "short".
2) All of my system header prototypes use "int".

Perhaps I should have avoided using int altogether. Then again,
sizeof(short) and sizeof(long) aren't carved in stone either.

It turned out that a couple of variables didn't get set properly within
my dialog callback stuff. Everything (almost) is fine now.

>perfectly first-time and I've never had any problems.

:-)
It was that way with my simple windowed dialog code, but there were just
too many small changes to do to make everything deal with multiple
dialogs.

>So it definitely is possible. It also a better way to do it since you still
>get the advantages of things like Let 'em Fly. If you write your own
>form_keybd, such advantages are lost.

Exactly. That's why I didn't even want to write windowed dialogs before.

I would have expected that MagiC would have a "bring this app to the top"
function, which would be a much nicer way to do than topping Ease's window.

I'll send the AV-Protocol documentation that I have by email since it's
quite large.

4829. GRAF_MKSTATE peculiarities...

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-10 00:00:00 UTC
From: Robert Aries <robaries@ix.netcom.com>
Message-ID: <33246428.13CF@ix.netcom.com>
Source record: 7329

From my limited lurking time here, I haven't seen any GFA people, but what the hey,
let me give this a shot...actually this may be more of a TOS than a GFA issue.

My program's main loop needs to look for keyboard & mouse events. With the
mouse, I need to select & highlight small pieces of the screen (I'm in ST high rez). I
was using the GFA calls MOUSEX, MOUSEY, and MOUSEK to read the mouse location
and button states. Then I learned that these calls use Line-A, and I should replace
them with AES calls. GFA 3.5 does the graf_mkstate function so I thought I'd go with
that.

The problem is that this call doesn't seem to work if the mouse is near the top of the
screen. I suspect that it has to do with conflicts with the menu bar, except that my
program doesn't use a menu (it needs the whole screen). Is there something I'm
missing? I'm not that knowledgeable regarding GEM stuff, having mostly programmed stuff for myself (so I really only cared if it worked on MY ST <g>). It
would be nice to make my program more "legal" so I'd like to try and work this out
(who knows, maybe two other people would be able to make use of my program
<g>!).

4833. Dsp booting

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-11 00:00:00 UTC
From: Frederic Bossut <Frederic.Bossut@etu.utc.fr>
Message-ID: <33252B7C.33C33D10@etu.utc.fr>
Source record: 7333

hi,

I have a little problem with the DSP.

I need for my MONOTACHE soft, to reserve the entire 16ko in x and y.

but the system seems to have already set something in, because it
doesn't declare me all the 16ko (using Dsp_Available(...))

I tried to take all the memory with a little loading dsp code

All is working, but after the end of my soft, a new call to the function
DspLoadProg() made by any other soft (even mine) set the computer in an
infinite loop and i have to reset the computer.

So,

-I would like to know if the sytem has some vital information in the dsp
(memory x and y in the 16 external ko)

-How to reconfigure the system to make it run after the dsp mnemonic
RESET?

-If some vital informations are let in the DSP memory (idem as above)
could the function Dsp_execBoot() set the computer as if it has just
boot?

-if yes, did it exist in the system an runable dsp code to boot with ?
(needed by DspExecBoot())

-In fact i try to use the dsp, in any of it's precedent state, and the
reset it to make it work again with other programms

Thank you

This is due to that the last part of the program memory, which is mapped on the last part of the X memory in Falcon, is used for a program uploader, which is used by DspLoadProg() and similar functions to upload your dsp code. So, if you in your dsp code overwrite this uploadcode, the next time you call DspLoadProg(), it won't be able to upload the program, and in the stupid way the function is made, it will hang the computer in an infinite loop trying to upload.

I don't know a way to really reset the DSP so that it restores the bootstrap uploader code I was talking about above. Obviously there is a

way, since a reset of the computer does it, but the risk is that it's made by hardware.
If anyone else knows, I would very much like to know too. It would definitely help me when using the DSP in linux.

I dunno GFA but a couple of points to consider ...

I'm not sure you should be using graf_mkstate() within the menubar.
The AES is aware of the desktop so it could be confusing it. Maybe you
can but someone else would have to verify this. I'd guess you'd at
least have to lock the screen. Might even have to install a dummy
menubar of your own even.

Anyway, the VDI might be a better choice. This is below the AES and
will definately be able to process a full screen.

>I'm not that knowledgeable regarding GEM stuff, having mostly
>programmed stuff for myself (so I really only cared if it worked on MY
>ST <g>).

A more theoretical point ...

If you encroach into the menubar then you will have problems with
systems like MagiC where the menubar is constantly being switched to
the active application. In situations like this you would need to have
your program installed as singletasking.

>It would be nice to make my program more "legal" so I'd like to try
>and work this out

Another thing with graf_mkstate() is that I have found it to be quirky
(I forget the AES version but it was either tos 1.2 or tos 1.2). I've
formed the impression (ie gut feeling) it lies at a level midway
between the aes and vdi.

>(who knows, maybe two other people would be able to make use of my
>program <g>!).

> I wondered if MiNT-threads can use GEM? I.e. can a thread run in a
> evnt_multi()-loop while the parent does the same?

They can, but there are problems: firstly, each thread needs to call appl_init() etc, just as the parent process needed to; and secondly, if you're using C, then the chances are that you will have to re-write the libraries for AES/VDI access since all of the arrays are held in global variables, and each thred needs to have it's own set of GEM arrays otherwise the moment any of the threads happen to make a GEM call at approximately the same time things will go haywire!

I believe that there is a library somewhere out there that gets around this problem, but I don't know where, or who it's written by.

Cheers,

James Cox.

Thanks for the tip. I tried using the VDI, but it is slow, slow, slow!
My loop is contantly querying the mouse location and button state, and
even when compiled, the mouse pointer flickers badly! Now, I might be
doing something wrong here, as I only half-understand the concepts
involved, but I'm using the VDI function vq_mouse(). Naturally, GFA has
its own syntax for accessing the VDI, but I think I did it right: First
I got the screen's workstation handle with graf_handle(). The Atari
Compendium also says something about a "device id" but I assume that GFA
handles this internally?? Anyway, I put the opcode for the function
(124) in contrl(0), set contrl(1) and contrl(3) to 0, and put the handle
into contrl(6)--all this is from the Compendium, and GFA has
corresponding arrays pre-defined. In my loop, I read the contents of
ptsout(0) and ptsout(1) [the mouse x & y coordinates] and intout(0)
[button state], and it does seem to work; the numbers returned are
correct, it's just that this is very slow.

I do appreciate your taking the time to help out...right now it does
look like I'll have to go back to the old line-a GFA calls though.
Well, I tried!

Source record: 7343

Hello!

GETMPB is, as far as I know, useless with anything than Tos, isn't that
correct?
Well, how do I find the MPB under MultiTos and MagiC? And how is the
struct of that thing? Is it similar to the one under Tos?

Atari compendium says that GETMPB is useless under Mint, and it looks like
it's useless under MagiC too.
Any help would be greatly appreciated!

Best regards
Geir...

Could this be the cause of the MagiC problem. Where sometimes, a call to the DSP (via the Brainstorm decoder) hangs the system. The only solution to this is to reboot the Falcon and it seems to go away (although sometimes a couple of reboots are needed)?

IIRC, GEM is not up yet. So when GEM comes up, it creates new environment variables.

It's interesting about what you are doing for DST. Is there an algorithm which can calculate the beginnin & ending of DST? I am looking for one to put into my world clock, called PH World Clock. Currently my clock handles it quite simply by having the user tell it that DST is on.

Kevin Tessner (ktessner@sstech.on.ca) wrote:

: What do I have to do to furnish them with a ready to run PC version of GNU
: configured for 68020 output in standard Atari .PRG files?

Build a version of GNU C which runs in a DOS or Windows PC environment and
generates Atari 020 or higher code. To do this, you must first download
the latest Gnu C sources. Take a look at the docs, they explain how to build
a cross compiler. You must also try to get hold of a libgcc1.a file for
atari (you could build it yourself with GCC on atari). And you must build a
PC version of the atari binutils package (I haven't been able to get them
to work on Linux yet. Good luck...) If you've done all this, then you
should be able to build a cross-compiler. Then all you have to do is
create a suitable PC environment for compiling, and bingo! You've got
yourself a cross-compiler... Theoretically...
A good place to start is the DJGPP distribution (a DOS version of GNU C)
at Simtel (ftp.simtel.com or www.simtel.com or whatever...) and the MiNT
patches for the GCC source (needed to create an Atari target. You should be
able to get them at most Atari FTP sites. Try ftp.fu-berlin.de)

If you pull this off I would like to hear from you! (I've been trying for
some time to set up a cross compiling environment under Linux. I failed...)

One reboot has always been enough for me, when such a problem occurs.
Although, I don't use MagiC. I haven't had this problem using Brainstorm's
decoder, but it may very well be this that causes it.
But it might also be if you have used another program which uses the DSP,
then the Brainstorm decoder is overwritten, and the program trying to use
it might hang, if it's not programmed with a timeout.

I have been browsing through the chapter about preprocessing in the best C-reference manual I know of, the second edition of Kernighan & Rithchie "The C programming language", and it doesnt say anything about redefining datatypes.

However, it says the following about datatype and sizes:

"The intent is that short and long should provide different lengths of integers where practical; int will normally be the natural size for a particular machine. short is often 16 bits, long 32 bits, and int either 16 or 32 bits. Each compiler is free to choose appropriate sizes for its own hardware, subject only to the restriction that shorts and ints are at least 16 bits, longs are at least 32 bits, and short is no longer than int, which is no longer than long."

Do a search on the HENSA site. I think there are a couple of good
assemblers to be found there.

Also, I believe there is a public domain version of Devpac, which was
given away on a magazine cover disk years ago. Try to get hold of a copy
of this as it is very good.

4852. Details on the Devpac GST linkable object format needed

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-14 00:00:00 UTC
From: Magnus Kollberg <emwoll@emw.ericsson.se>
Message-ID: <yvvybbqn3aq.fsf@emw.ericsson.se>
Source record: 7402
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

Hi everyone,

I forward this message for Doug Little. If anyone knows please
answer me directly or post in this newsgroup. It's _very_ important.

Hi,

Does anyone out there know where I can find details on the Devpac
GST linkable object format, or the Lattice Linkable format? I need
22-character linkable output from Devpac, so DRI isn't good enough.

Needless to say, it's not enough just to switch to another linker
which supports these formats since I intend to link with GNU objects,
and so need to write a utility for Devpac->GNU conversion. I already
have GST2GNU.TTP, but it won't read Devpac GST binaries. The Devpac
BIN format is completey different from the one accepted by GST2GNU
(I don't know why). I have examined the GEN output and compared it
with the header structures used in GST2GNU and they are not even
vaguely similar.

Any help would be _very_ welcome.

Doug.

hi, i'm looking for some definite guide how to programm the new
AES and the new XBIOS routines for F030s TOS4.04 and how to set up
a clean DSP programming within the F030 System ...

furthermore i'd like to have an instruction set, programming &
optimation guide to the DSP56001
NOT the a56.ttp ftp-archives those i have already !

can anybody help me ?

For all this, and much other information, I think the Atari Compendium is the best. It includes all neccessary things, I think. For the later AES versions, 4.0 and 4.1, I know there are textfiles about those, but I don't know where to get them, try ftp.uni-kl.de or ftp.cnam.fr

> furthermore i'd like to have an instruction set, programming &

The DSP56000/DSP56001 User's Manual by Motorola is very good to have. It has all things you need on how to program the DSP, but no Atari specific things obviously. It doesn't contain optimisation either.

About an assembler to use, a56.ttp isn't very good, I know, but unfortunately it's the only freeware DSP assembler available for Atari. There are at least two non-free assemblers too, DevpacDSP, which isn't very good at all but has a GEM shell, and Motorola's asm56000.ttp which is, IMO, the best. At least I think Motorola's assembler isn't freeware, I may be wrong. I know the sources aren't free.

I've started to write a series of pages on my homepage about programming the DSP on Atari. Unfortunetely, I've been too lazy and to busy at school to write more on it lately. The URL for it is
http://www.lysator.liu.se/~tobe/DSP/

Greetings,

Tomas

Then it's possible and legal, as it should be. In case anybody is
confused ...

The preprocessor does not form part of the 'C' language. The 'C'
compiler starts its work on the output the preprocessor produces - not
on the stuff you type in. ie all the "#" keyword stuff has gone.

From: gary@the-gap.demon.co.uk
Message-ID: <12654411_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 7412

Back in the good old days(?), a program could detect that it was running as an accessory, by checking a7 on entry to the program. If it's 0 then it's an .acc.

With multitasking (certainly multitos), this no longer holds true :(

What is the best way to see if you're an .acc or .prg under *all* TOS's?

TIA, Gary

It's written by Andreas Kromke, the programmer of MagiC, and can be found
in Application Systems Heidelberg's BBS (don't have the number here).

That is correct, but even more : It is useless even with TOS. Reason is
the call does things that confuse the internal memory management. It
really should not be used.

Apart from this, memory management is the most internal thing in any
operating system, and by far in most cases it is neither needed nor
advisable to interfere with it.

> Well, how do I find the MPB under MultiTos and MagiC? And how is the
> struct of that thing? Is it similar to the one under Tos?

MultiTOS uses the same scheme as MiNT, and that is AFAIK the same as the
TOS system. MagiC does it completely different.

> Atari compendium says that GETMPB is useless under Mint, and it looks like
> it's useless under MagiC too.

It's not useful anywhere.

> involved, but I'm using the VDI function vq_mouse(). Naturally, GFA has

Do not use VDI input functions if AES is active. Reason is AES will fetch part of the input, your application another part, neither of the parts having the complete information. As long as AES is active you must use the AES input functions, and for that, if you can tolerate busy waiting, graf_mkstate is just the perfect choice. I doubt that your problem was due to AES, in single TOS graf_mkstate should certainly work even in the area where normally the menu bar appears, if no menu bar is activated (via menu_bar(..., TRUE);). If you have a menu bar, however, then of course graf_mkstate should not work as usual if the mouse enters the menu bar. So if your graf_mkstate does not work at the top of the screen, even though you use single TOS and no menu bar, then I suspect strongly GFA does something strange about this.

Note that not allowing a menu bar, relying on single-TOS and busy waiting is not state-of-the-art programming anymore. Instead, use wind_get (0,...); to inquire about the screen area you may use (this already does exclude the menu bar !) and you won't have any problems with the top of the screen anymore (simply because you're not using it), and MagiC may put other application's menu bar there without any harm for your program.

Next step is using evnt_multi(); or evnt_mouse(); for inquiring about the mouse parameters, this allows cooperative multitasking.

Cheers Peter

I found such a library, it's called MT_AES and is written by Andreas
Kromke. I haven't tried it yet, but according to the docs it should
work with MagiC (Of course...), MultiTOS and N.AES.

I found it on ftp.funet.fi/pub/atari/Newitems a couple of days ago.

Yes, and if you are using MiNT, its variables get created first, before those of the AES. Under MultiTOS and Geneva 005, the env vars specified in MINT.CNF get inherited by the AES.

As far as the AUTO folder goes, however, there's not much use in dealing with env vars. Even if you were to create some in the "parent" basepage of AUTO folder processes, they would go away as soon as either MiNT or the AES comes up.

There is no one algorithm for Daylight Savings: every country handles it differently. I had to deal with this problem in my own program, WorldClock :-) (Available from www.pair.com/gribnif/)

>>
>>2) I have written a little program which sets daylight saving time

Not really, if all you are doing is stdio. It's only when you start to use Pexec() or any part of the AES that you might be hitting problems. Perhaps if you posted a skelton of your program, someone could help.

That's right, always use the a7 test. It works under Geneva, MTOS, MagiC
and, of course, old-TOS.

Someone else will be able to explain this part more accurately, but I
believe that most shells which run under MagiC launch new DA's (not at
startup) by treating them as programs. IIRC, there may not even be any way
to truly launch a desk accessory AS a desk accessory from MagiC after
startup. But I haven't seen later versions of MagiC so I could be wrong
here.

On the other hand, both Geneva and MTOS use the GEMACC env var in GEM.CNF
to determine which extensions are treated as DA's. Anything matching the
extensions is launched as a true DA with the correct (zero) a7.

4873. Pexec-question

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-17 00:00:00 UTC
From: josk@ifi.ntnu.no
Message-ID: <332d707e14aa00@ifi.ntnu.no>
Source record: 7423

Hi!

Can anybody tell me what's wrong with the following code? (Running
under MiNT 1.14/N.AES)

```
if (appl_find("V-CONFIG") < 0)
Pexec(100,"V-CONFIG.PRG","",NULL);
```

The program (V-Config) is started, the parent keeps on running in
paralell and everything looks fine. But when V-Config exits, it leaves
a "empty" process, i.e. a process with status EXIT and size 0. If I
call/exit V-Config a number of times N.AES crashes.

If I use mode 0 everything works, except that the parent is blocked.
This is totally unacceptable as these two programs are supposed to
talk to each other.

The Atari Compendium says that mode 100 is identical to mode 0 with
only two exceptions: The parent runs in paralell with the child, and
pexec() returns the pid of the child instead of an exit-code.

>environment variable?

Well, I think I'm a reasonable person, so if using a cookie would be
reasonable, I don't see why you couldn't talk me into it... :)

Meanwhile, I don't understand exactly what you mean. I don't see any
problem in using a cookie, but then some other program must establish
the cookie, because what I'm concerned with is reading out certain
information, like timezone information and the location of
directories. Normally, this is not the sort of information one would
store in cookies, is it?

>...when V-Config exits, it leaves
>a "empty" process, i.e. a process with status EXIT and size 0.

What happens is that V-Config leaves a "zombie" process, which is just
a placeholder in MiNT's process table that saves things (like timing
statistics, and exit code) that the program which launched it may be
interested in. When the exit code is collected by the Pwait() system
call, the zombie is deleted from the process table.

Zombie processes should be harmless, and will be deleted automatically
when their parents exit. But if you want to avoid creating such processes
in the first place, have your program do a Psignal(SIGCHLD, SIG_IGN) before
the call to Pexec(100,...). This will tell MiNT that the caller isn't
interested in the child's exit status.

If you mean the old 8-bit stuff, check out http://www.emulators.com/ - home of the guys who wrote PC XFormer, the 8-bit Atari emulator. As well as selling XFormer cables to do the thing you want, they have plans available to build your own cable.

ATB, Frank.

4878. Toolbox API (was: DLLs for Atari)

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-18 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <3137cd$11416.1a8@HERMES>
Source record: 7428

As you may be aware, I have been working on a TSR that gives DLL-like capabilities to the TOS platform.

I would like to make this a reasonably "open" standard for the Atari, so this is the beginning of a series of articles describing the Toolbox interface as seen by extensions/plug-ins/libraries (I have yet to settle on what the correct nomenclature will be), and by apps that use them.

The Toolbox originated as a resident library of code that I found I was using in all my apps.

Over time, it gained the ability to load extensions at boot time that could be called by the foreground app to do some specialised processing.

Now, before I release the Toolbox for general use (it has previously been used exclusively alongside custom apps I have developed), I'll begin by discussing the Toolbox/extension interface.

The Toolbox was designed around the TOS filesystem, and to load before MiNT.

After the Toolbox has loaded at boot time (from within the AUTO folder) and then finished initialising itself, it then switches to the path "\TLBX". Within this folder, it looks for "Toolbox Extensions" (with a filename extension of ".TE").

It then examines them, and if they conform to a small set of rules, the extension is loaded, and given time to initialise itself.

The extension receives info about the Toolbox it is plugging into, and a bit about the computer. It can then examine this info, and initialise itself. Once this is done, it must call a "callback" function, and then returning a magic "Yes/No" value, and a pointer to it's info block to the Toolbox.

Unfortunately, this is more an assembler-level interface. Higher level languages will need to have changes made to their startup stubs.

And then the Toolbox carries on searching for more extensions. When all have been loaded, a final clean up is done, and then the Toolbox goes TSR.

Later on, the foreground apps can load a specialised extension using a LibLoad() Toolbox API call.

However, only one copy of any extension (based upon a unique "cookie" identifier within the extension info block) can be loaded at one time.

At present, there can be only 16 extensions loaded at at any one time. This value will be raised later on.

Following is the source code to a sample extension, complete with a couple of nonsence API calls. (It was written in 68k assembly language using Devpac 3.1).

It is known as a "dynamic" extension, as the ID number is generated when the extension is loaded. _NO_ extension my have a static ID number (other than those I have written aeons ago).

Please feel free to comment on it (in this newsgroup). I would like to make the Toolbox/Extension APIs an "open" Atari standard, and discussion involving other programmers will lead to a better standard.

Why can't I get vqt_name() to work? I think that's the right function :-)

I'm (trying) to use it like this:

font_index=vqt_name(vhandle,number,font_name);

That compiles fine, but crashes while running!

I guess as I want to get font_name I should really use:

font_index=vqt_name(vhandle,number,&font_name); ????

But this won't compile!!!!

If anyone can supply me with a short little demo for changing/using fonts,
I'd be grateful. PS. I'm using NVDI 4.11 ----- Yes, those fonts!!

This is the kind of information that doesn't change a whole lot so could be stored in a file (*.inf) which I suspect is available even to auto folder programs (how would some of the editors etc work otherwise.)

m > font_index=vqt_name(vhandle,number,font_name); That compiles
m > fine, but crashes while running!

Try defining font_name as

char font_name[33];

BTW, font_name[32] will contain a 1 on return when the font is
proportional.

> Please help me!

The ST parallel port is nothing more than one of the parallel port
of the Yamaha sound chip.

Register 7 in the Yamaha allows you to change from output to input
(for the data bus D7-D0).

I guess that the behaviour of Ack and/or Busy can also be changed, but
this time it is related to the MFP.

Please let me know if you need more information (E-mail me) and I will
bring some documentation with me next time I come to my office.

Check the number variable. Perhaps you pass an invalid value. It
should not be greater than the value returned by vst_load_fonts().

From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.95.970319185345.20580A-100000@usr08.primenet.com>
Source record: 7437

Hi, I am doing a program, It's an ACC, it works fine so far except
that under MINT, it doesn't want to appear in the accessory menu.
With PS, I can see that my acc is loaded, but is in the sleep status
and not ready status, thu snot appearing in the menu.
If I SIGCONT my acc it will then appear in the menu.
So why my acc doesn't receive the correct signal when the machine
boots in mint?
BTW, this ACC works fine under TOS and Magic.
Any help would be appreciated.
NOTE:. I use GFA basic.
I use appl_init() and menu register
Thanks

The ST isn't 8 bit either. He was referring to the "old" Atari 800
(XE/XM/whatever) series of 8 bit computers.
But you are right, the ST isn't old. 12 years is nothing compared to the
time UNIX (not actually a system but an OS) has been around. And what to
think about PC's... They've been around for 17 years.

Hi,

I'm not sure if this is a GFA basic problem, but I've done it successfully
in C. You might be able to convert it to GFA basic.
This is a piece of code from my GEM interface for mp2 player. This works
for me on both TOS and MiNT, haven't tried MagiC myself, but others tell
me it works there too. The _app variable is a PureC variable to tell if
the program is run as .PRG or .ACC, if the program is always .ACC then
this wouldn't be neccessary.

```
if ((app_id = appl_init()) >= 0)
{
if(!_app)
acc_id = menu_register(app_id, " MPEG2 Audio ");

/* program follows */
}
```

Hope it helps!

Tomas

4891. Re: Toolbox API (was: DLLs for Atari)

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-20 00:00:00 UTC
From: jamesco@cogs.susx.ac.uk
Message-ID: <5gs7b9$e7u@infa.central.susx.ac.uk>
Source record: 7441

Gaven Miller (gmiller@inca.co.nz) wrote:
: The Toolbox was designed around the TOS filesystem, and to load before MiNT.

: Unfortunately, this is more an assembler-level interface. Higher level
: languages will need to have changes made to their startup stubs.

I have had a look at the sample code in your original post -- keeping that architecture is going to make it very difficult to write TE's in anything other than assembly. My component system doesn't perform any checks to see if you're loading a valid component -- I have authorised and unauthorised components wherreby the system admin (my system is MiNT only) sets up the authorised stuff, and users set up their own unauthorised components. If a user tries to load some program as a component, then they will only crash their own component server, not the entire system.

When a component is loaded, the component server responsible for it simply JSR's to the first instruction in the text section (if you know anything about writing .XDD's or .XFS's in C, then the method for writing the startup stub is identical). This function is expected to return some information about the component and is given a few bits and pieces as parameters on the stack.

I also note that your system is a TSR:

: Later on, the foreground apps can load a specialised extension using a
: LibLoad() Toolbox API call.

this will cause problems under a multitasking environment (which is really the only place where components/TE's/modules/shared libraries/what ever are needed). If we're in SingleTOS with no MiNT, then we have the same problems that desk acessories have with allocating memory: the running application loads a module, and that module's memory is owned by that application. Some other application that is running could theoretically use the module as well (the whole point about creating modules is to share code) but when the host application quits, the module's memory is freed up and the other clients using the module crash.

You could argue that modules can be used in a simgle task environment to facilitate plug-ins to programs (file filters to load different formats of pictures/sounds/text/etc) but a TSR system would miss out on the whole code sharing idea.

The trick is to make the program that governs your modules (Toolbox manager/component manager) a process that is always available. My component manager, once loaded, just sits there and waits of a message to be sent to it telling it to do something. Basically, it would be used for two things: loading a component (so that component's memory space belongs to the component manager); and removing a component from memory.

Once a component has been registered with the component manager, it would normally be unloaded from memory, and only loaded back into memory when some process wishes to use that component. Once all the processes utilising some component have finished with it, the component is removed from memory again. An application sends a message to the component manager to ensure that the component it wishes to use is made ready. The result from this operation is the pointer to that components info block. When an application is done with the component, it just sends such a message to the component manager again.

: At present, there can be only 16 extensions loaded at at any one time.
: This value will be raised later on.

I can have as many as memory will permit -- I have written a defragmentable memory allocator to help out with this :).

: Please feel free to comment on it (in this newsgroup). I would like to
: make the Toolbox/Extension APIs an "open" Atari standard, and discussion
: involving other programmers will lead to a better standard.

I will post my standard for component managers/servers in the next few days for a comparison. However, one thing you must understand is that my code is far from completed. The first version will most definitely not have unauthorised components (a security feature, but then most people won't need to worry about this anyway!).

Cheers,

James Cox

Hi thanks for the help, but here is what I use exactly. It looks like
what you wrote down there.
' IS it really an .ACC
ap_id&=APPL_INIT()
'
IF ap_id&<>0 ! not interpreted
' insert .ACC into menu bar
me_id&=MENU_REGISTER(ap_id&," myprogram")
DO
' detect .ACC selected
~EVNT_MESAG(0)
' ? is it our .ACC?
' note check both for an acc, and it is our acc
IF MENU(5)=me_id& AND MENU(1)=40
deal_with_acc ! if so deal with it
' and return back to here
ENDIF
LOOP ! .ACC's are endless loops
ENDIF

Any idea?
thanks. :)

Cookies created by TSRs often contain structure pointers, which
means they can provide all sorts of information.

But if all you want is to read some previously established data by
one program, then a *.inf file is the way to go. I thought you were
trying to create an environment variable to be used by other
programs.

Re. environment variables: it's bad enought that we have to support
bad (UNIX) programming practices. The least we can do is not
propagate them.

Hey Eric...

Good to hear from you again, and I really hate to inform you of this, but the ST is not an 8-bit machine!

I have, however, gotton that ol' 800 working well with the disks and everything... so I'm looking to move some basic-type stuff onto the floppies for that as well.

My question is this: Does an ST have an SIO interface to hook up 8-bit peripherals? I'm getting an (Not old - middleaged) 1040ST in May.

Cya l8r,
"Merch"

No, but there was a custom cable designed for use with Darek Mihocka's
8-bit emulator on the ST. I can't remember Darek's e-mail address, but
his company (which markets 8-bit and ST emulators for the Windoze) is
called Branch Always Software (BRA-Soft) and is on the web... perhaps he
still sells these cables?

:-P I guess it doesn't then!
Any (C) sources somewhere ? GNU ? I could recompile/port it ?

I've seen so many other "odd" languages for this machine, like
X-lisp, fortran and (toy)prolog so why not COBOL ? :)

ST+ ISSUE 14
The Monthly ATARI PD Diskmagazine
http://www.geocities.com/TimesSquare/Alley/7454/
Editor Dave Hollis
Compatable with All ATARIs Min 1 Meg,
ST, STe, Falcon, Mega's and TT

ST+ Has been released at the end of every month for over
a year now, At last it is on line and available for download
from its new home at the above url, the page is under
construction so bookmark it and keep going back, not forgetting
your RELOAD/REFRESH Buttons :)

You will have to hurry for Issue 14 as ST+ 15 is due for release
at the end of March,

** NOTE ** PaCifiST users can downlaod the diskzine as a ready to use
PaCifiST image file to run in your brilliant ATARI emulator, just go
to the page and follow the links.

This Diskzine is Free, Its Current, Its got loads in it and it
is released EVERY Month

Heres a list of what you can read in this issue........

** NOTE ** This is NOT a STOSSER Software release, I make the
Diskzine shell for this and many other current UK Diskzines,
However Much needed Feedback, Comments, Snippets and maybe even
Articles, as well as reviews, messages and Letters, can all be
sent to me at stp@stosser.airtime.co.uk and will be instantly
passed on to the Editor Dave hollis...........

ST+ 14 INDEX OF FILES

REGULARS

[] THIS ISSUE.......This file...
[] SHELL INFO.......Some info to get the best out of ST+.
[] WELCOME AGAIN....My usual bit from me, myself and I.
[] CONVENTION REP...More info on this great idea.
[] CONVENTION INFO..CiH has a few things to tell ya.
[] READER LETTERS...More of your views and suggestions.
[] NEWS.............Only a few bit's this month.
[] STOCKMARKET......Reader adverts.
[] QUESTIONNAIRE....Reader feedback,
[] KONTACT KORNER...Wanna get to know some new Atari users

ADVERTS
The following are commercial adverts...

{} ALIEN TECHNOLOGIES.
{} ANALOGIC.

He's serious. I've done programming in Cobol as well. So, in essence, that makes it a valid question. I've not found it yet. I'd like to get a copy of this as well.

However, there's C, Basic, assembler, and other packages galore.

> X-lisp, fortran and (toy)prolog so why not COBOL ? :)

COBOL is icky, that's why! It's such an impossible language, anyone would be
better off learning C since it's actually viable.

I use STOS myself! :-)

I see you've never tried programming in it. I have, and have programed
quite a few things in it. Sure, C is good, but there are some rather
wicked things you have to learn that make it a little hard in some places.
However, Cobol can be weird, since it doesn't have the math things,
rather, you have to ADD x TO y, SUBTRACT, and then some. That makes a
normal one-line calculation into around several lines of Cobol.

Actually, I've been forced to take classes in COBOL. Not getting into any specifics or anything, but you have to type a lot of code to get few results. I'm sure it has it's benefits, but just TRY to get instant results like you can with BASIC. And C is so much faster...

My biggest beef was those #$%*! periods after each line. Ewww...

I never thought of environment variables as bad practice. Maybe
because I tend to look at Unix as THE example for any programming
environment. Why, in particular, do you think it's bad practice?

Not so. There are plenty AUTO folder programs that set environment
variables during start-up and they don't "go away". But even if they
would go away as soon as MiNT or the AES comes up, why aren't the
available to other AUTO folder programs that come after the env var
program?

A while ago, I had a program sat on my hd that ran through a path of
Windows .ico files and produced a .rsc file of them.
They could then be treated as Atari icons.

Of course, now I need the thing, I can't find it! :(

Has anyone got an idea of what this program is called and where I can find
it?

TIA, Gary

j > I never thought of environment variables as bad practice.
j > Maybe because I tend to look at Unix as THE example for any
j > programming environment. Why, in particular, do you think it's
j > bad practice?

First of all, I abhor using text (command lines, environment variables, scripts, etc.) for program-to-program communication. Admittedly it makes the data user editable (technically), but expecting the average user to be able to edit such text is to make the program difficult to use (e.g. HSmodem). If the user is NOT supposed to edit the data directly, then leave it as binary (which is smaller and easier to process). This is why I prefer the cookie jar to the environment list.

Second, if every program on your computer used one or more environment variables, imagine how big and cluttered the list would become, and how long it would take to scan through the list to find what you were looking for, not to mention how complicated the script needed to boot up with would be.

What environment variables are good at is multi-user systems where each user wants to get different results from the same program. Specifically, it is needed to locate the user's directory to FIND the appropriate *.inf, *.cfg or *.dat file. It is a solution to a problem which does not exist on single user computers.

As for UNIX, I have used many operating systems on many computers in my career, but was aghast at my first exposure to UNIX. How such a godawful collection of kludges and quick-fixes ever became an industry standard is a mystery! I suspect it had something to do with the price (which is more than compensated by lower productivity, but you don't find out about that until too late).

That's ICO2RSC which you are looking for.
I have set up a page for these hard to find file. You can find ICO2RSC at

http://probehouse.home.ml.org

under the Useful Software section. More coming soon.

Forced, as in a requirement? Since I'm familiar with Cobol, I'm familiar with the requirement of a lot of code. I had to write a mail interface program for this one company, and they were on a mainframe system. So, that meant I had to wait awhile before I could get the damned printout, and so on. It's perfect for business. I'm getting a copy of a compiler for my 486 just so I can remain in practice. [sigh]

But of course, it would be nice to have a computer that would allow you to do Cobol programming the way Basic was done. Just program, and type RUN. I'm still learning C.

That reminds me... Is Steve Yelvington, author of the MODEMIO text file, still around? That file he wrote was back in 1990. Is there a current version of this?

: My biggest beef was those #$%*! periods after each line. Ewww...

Tell me about it. I regularly forgot to put the semicolons in Pascal. With C, you still have to worry about the periods. Not so with Basic. And they claim it's a dead language? ye gods...

I wrote a short accounting program for this one business, and purposely put in one bug, to ensure they called me back. Guess what? It's been 8 years now.

However, now that I think about it, if you install MiNT, and can find GNU Cobol around, and compile it, that could probably do it.

Really... Well, you learn something new all the time, as the saying goes.
If anyone has any sample code for modifying the vars so that they are
persistent, I'd be interested in seeing it.

From my understanding of the original post, the person wanted to create
vars from the AUT ofolder and have them persist even once GEM had loaded,
which I had previously thought would not be very easy to do. I wasn't
denying that you could create env vars that would be available to other
AUTO folder progs.

Of course, this is all pretty much a moot point, since it sounds like he's
going to go with a different method anyway :-)

NeoDesk's icon editor can also read .ICO files directly. But if you really
want them in .RSC format, this won't be of much help.

4918. NOS and INN 1.5 news server

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-24 00:00:00 UTC
From: bkozlowski@nordnet.fr
Message-ID: <859217962_OASIS_@nordnet.fr>
Source record: 7269
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.atari.programmer

[followups in tech group only]
[posted also to NOS mailing list]
[no crosspost to demon.ip.support.atari, they are not concerned]

Hello all!

Many news servers update their software to INN 1.5 or 1.5.1. They'll update faster to 1.5.1 now, after the "all-time bigest Usenet attack" last week, as 1.5.1 is the only server protected against this cracking method (well there are patches for some other servers, but...).

This leads to problems for us NOS users, as this versions disable NENNEWS command by default, we receive "502 NEWNEWS command disabled by administrator" and the sessions fails, no news... Well we can post our messages, as they are posted before the get news procedure. Maybe it's time to change NOS's strategy to get news, the NEWNEWS command is supported by less servers each day as it uses on the server more memory and CPU time than any other nntp command.

In the meantime, if you can, ask your news administrator to change his config.data file, partial quote below:

```
----------- 8< ----------- [INN's config.data] ----------- 8< -----------
## Allow the NEWNEWS NNTP command? Pick DO or DONT.
## (RFC 977 says you should; your server performance may not agree...)
##### =()<ALLOW_NEWNEWS @<ALLOW_NEWNEWS>@>()=
ALLOW_NEWNEWS DONT
----------- 8< --------------- [end quote] --------------- 8< -----------
```

Easy to guess, he must change the "DONT" to "DO" in the last line. Perhaps he also needs to recompile INN, or only to restart it, it's not clear for me. While we're with config.data, there is an option (on by default) to slow down service for offline readers. Another partial quote:

```
----------- 8< ----------- [INN's config.data] ----------- 8< -----------
## Do you want to make life easy for peers to pull feeds from you (it's
## harder on your machine). Pick DO or DONT. With DONT, you get a small
## sleep inserted before each ARTICLE command is processed. (With
## apologies to the Australians in the audience).
##### =()<LIKE_PULLERS @<LIKE_PULLERS>@>()=
LIKE_PULLERS DONT
----------- 8< --------------- [end quote] --------------- 8< -----------
```

Same thing here, change last line into "DO", if you have a nice newsmaster he'll do it. Otherwise you have a one second pause between each article. And if someone could explain me the "Australians" stuff...

```
Bye! Bruno.

I wonder if anyone took advantage of Atari's "Valuable Voucher" they included when buying the 1040ST. When I bought my ST in 1987 I was tempted to take advantage of buying the "BOS/5 Operating System" and the "BOS/MicroCobol Development System". They also offered various accounting and office products written in MicroCobol.

I filed the voucher away with my manual and forgot all about it until last year when I came across it again. I was tempted to fill it out and send it to "BOS National" in Dallas, Texas just to see what kind of reply (if any) I would get.

This is the only Cobol for the ST I have come across.

>So why my acc doesn't receive the correct signal when the machine
>boots in mint?

It sounds like the acc is doing some I/O, either through the BIOS or
GEMDOS. If you can't see where in the code you're doing this (print
statements, perhaps?) then it could be a GFA library problem.

The best solution is to stop doing BIOS or GEMDOS output from the ACC.
If this isn't feasible, a work around would be to do the equivalent
of the C calls:
Psignal(SIGTTIN, SIG_IGN);
Psignal(SIGTTOU, SIG_IGN);
somewhere early in the code -- this tells MiNT not to suspend the
process if it does I/O on the console.

Ermm... Yes. I don't think the teacher was all that thrilled with it either. Then, when I took Turbo C++, that teacher absolutely DESPISED COBOL! I really hated it so much because it seems so wordy. And I would always forget a period somewhere which would cause about 15 errors. It would take me an hour to write a program that would put my name on the screen! Something I can do in BASIC in about... 3 seconds?

The sad part is: I was really excited about learning it. Until I learned it!!

> Tell me about it. I regularly forgot to put the semicolons in Pascal. With
> C, you still have to worry about the periods. Not so with Basic. And they
> claim it's a dead language? ye gods...

BASIC dead? Puleeze. BASIC will be around for a VERY long time to come. What? Are they going to train people programming on Turbo C++? That's not a good starting point for a programmer.

> However, now that I think about it, if you install MiNT, and can find GNU
> Cobol around, and compile it, that could probably do it.

If you can find GNU COBOL around, it could be recompiled for Linux, and you could run it on the Falcon!

BTW, what was the latest revision for COBOL?

Sometimes Cobol does require a little more time and thought to come up
with a good program. When I was in this class, and someone complained
about a variable, I always told them to look up, at the beginning of the
program. The error was usually right there. Later on, I'll try posting a
short quickie program that'll put someone's name on the screen, then
compare it to basic, C, and maybe Pascal.

: The sad part is: I was really excited about learning it. Until I learned i

The interesting thing is that when I learned it, and we got to the point
of 2D or 3D tables, I was at the point where I could, literally, do a
10-dimensional table, and finish the program before everyone else.

: BASIC dead? Puleeze. BASIC will be around for a VERY long time to come. Wh
: Are they going to train people programming on Turbo C++? That's not a good
: starting point for a programmer.

Basic has the problem of not being structured, what with all the GOTOs and
GOSUBs, depending on the flavor of Basic you use. The first few programs I
wrote in Basic were on a TRS-80, of all things. One was a slot
machine-like one, another one was like the Simon game, where you remember
the colors, and a few others. I don't know what happened to them.

What is a good starting point for a programmer? People have started
learning with various languages out there. I've seen some actually do some
Fortran, and the entire program looked like a mess. The first C program I
wrote used Mark Williams C, and I bought a used copy of Lattice C 5.5
something, so I really need to get back to it.

: If you can find GNU COBOL around, it could be recompiled for Linux, and you
: could run it on the Falcon!

I may have confused it for GNU Pascal... But of course, you can do that.
That's one reason why I like the GNU things, since it can be recompiled on
various systems out there. Only problem is that I've not installed Linux
on my DX4-100, or MiNT, though I have a Sun 3/60 diskless workstation.
Still am trying to learn it. It's got an ESDI drive in it, though I'd like
to try to replace it with a SCSI.

: BTW, what was the latest revision for COBOL?

Last I heard, it was around 1990 for the latest revision. It's been awhile since I've done serious work with Cobol.

4926. hash table packer

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-25 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <6d4_9703251643@conchbbs.com>
Source record: 7277

In the process of developing an RTF decoder, I wrote a program to generate a "packed" hash table from a list of code/keyword pairs and save it as a DRI format object file. I was wondering if it was worth uploading?

The hash table uses the structure

```
typedef struct {
short parent; /* index of parent node */
short base; /* used to compute child indexes */
short code; /* keyword code (or default code) */
} PACKED;
```

and computes the hash table array indexes using

```
index = p->base + (unsigned char) *(text++);
```

The program can usually pack all of the nodes into an array with no wasted space and no conflicts (looking up a keyword of length n requires exactly n table lookups).

Packing the 34 C language keywords took a couple of seconds, while packing the 536 RTF keywords took about an hour (on a TT). A faster solution is also possible by increasing the array size.

BTW, I am familiar with the so called "perfect hash," which cannot distinguish keywords from typos without a string compare.

This I don't know, but I'm very interested too, if anyone knows/finds out!

> How many memory is there in each part of the dsp
> for p,x and y
>
> (i think about non shadowed memory, wich mean a really mermory where i
> can set a word without erasing another part of the dsp memory)

This is pretty complicated on the Falcon, and I don't have the exact
memory map in my head. But this is approximately how it is. (words in here
are 24-bit DSP words)

Internally in the DSP chip there is 512 words P(rogram) memory, 256 words
X memory and 256 words Y memory. These are always free to use without
risking overwriting other parts. But, the first 64 words in P mem is used
for interrupt addresses.

Externally, there is a total of 32K words, divided in two 16K words parts.
These parts are the lower 16K of the X and Y mem respectively.
The P memory is then mapped over these parts to form a "separate" 32K
program memory. The lower 16K of the P mem is the same physical mem as the
16K Y mem and the upper 16K P mem is the 16K X mem.

There are parts missing in the description, among other things what
happens when the X and Y memory ROM are enabled. This is where my memory
lacks. I checked this once and made notes of it, and they are somewhere :)

If you have Brainstorm's DSP debugger, it's pretty easy to check exactly
which parts are mapped over other parts.

Greeting,

Tomas

Source record: 7280

Hey all,

I was just rummaging around my TT's registers a few nights ago and I noticed that it has the STe's shifter address low register ($ff8205 IIRC), which lets me set the screen to any 8-byte boundary. But there seems to be no smooth-scroll register ($ff8265?). It seems strange there would be only 'some' of the STe's video functionality in the TT. (Also I noticed that $ff820b, which is described only as 'reserved' in the TT tech docs, definitely does things to the VGA display if you diddle bits 1 or 2).

Anyone know the scoop on this?

Thanks,

-Russ

I wouldn't exactly call it a problem. BASIC is more flexible because you can structure it as you wish. I used to do spaghetti code, because I didn't know anything else. But, learned it was better to AT LEAST have modules. GOTOs aren't bad. You just have to avoid abusing them.

> What is a good starting point for a programmer?

I still think BASIC is the best starting point. After all, that's what it was intended to be: Beginner's All-purpose Symbolic Instruction Code.

>jar to the environment list.
>

Programs should be written for the largest number of people possible, not just the lowest common denominator. While I agree MOST users will not edit the data from a program directly, having this at ones disposal is greatly appreciated with the need arises.

The biggest reason to use the cookie jar over the environment on TOS has to do with the various shells it use. Yes, most users are using a shell, but don't realize it is a shell because it is graphical. NeoDesk, Ease, the Desktop built into MultiTOS as well as MagiDesk that ships with MagiC are all shells. They are just graphical, but none the less shells. These programs wouldn't know that the environment has changed and as such, they would not properly pass the envirornment to the next program. The cookie jar would solve this problem, but then you are using precious RAM to store program to program information that may be better suited to a temporary file.

>Second, if every program on your computer used one or more
>environment variables, imagine how big and cluttered the list would
>become, and how long it would take to scan through the list to find
>what you were looking for, not to mention how complicated the script
>needed to boot up with would be.
>

I agree that for the novice user this can be a pain, but everything in the computing world has a purpose. One should pick the BEST solution that is feasible.

>What environment variables are good at is multi-user systems where
>each user wants to get different results from the same program.
>Specifically, it is needed to locate the user's directory to FIND
>the appropriate *.inf, *.cfg or *.dat file. It is a solution to a
>problem which does not exist on single user computers.
>

Environment variables are also good the store user custom options, without taking up a large quantity of disk space for what is really a small amount of information. Remember, config files eat 2k or more depending on the format of the disk. This is a lot of space for 10 bytes of information.

The Unix philosophy is that each program should do one thing and do it well. This leads to lots of programs. The rest of the programing world has decided that one program should do everything conceivable, which leads to program that are large and do nothing well (the Microsoft Kindom comes to mind).

These are just MY opinion.

There were some programs I'd seen that looked more like spaghetti code
than anything else. Unreadable stuff, you couldn't even tell what the
program did due to all the jumping and so on it did. I heavily modified a
Forem XE BBS program, rewriting a couple routines and so on, making it
work better. It had modular areas, and you could tell.

The GOTOs are unconditional jumps, which force the program to go
somewhere. GOSUBs merely tell it to go one place, then a RETURN to have it
come back to where it started. On an 8bit, if you do;

1 GOSUB 1

You'll end up with an out of memory error. It uses memory to keep the last
known line number where it jumped in a stack. A RETURN pops that number
off the stack.

A BASIC program without them can easily be readable, yes, but you do need
them at times.

: I still think BASIC is the best starting point. After all, that's what
: it was intended to be: Beginner's All-purpose Symbolic Instruction Code.

Some other people don't seem to think so. They say it promotes
unstructured code writing. This was long ago, around the 80s. Today, you
got the more modern flavors of Basic that have modular areas, without
using line numbers.

: Hmmm... I think I learned on COBOL 85. This was back in '90, so it must

b > using precious RAM to store program to program information
b > that may be better suited to a temporary file.

The environment is also stored in RAM, generally takes more than 8
bytes per entry, and must be searched by string compares (instead of
a single long compare per entry).

b > The Unix philosophy is that each program should do one thing
b > and do it well.

I wasn't aware that UNIX had a design philosophy; it just grew.

A case in point is termcap, which was intended to solely to enable
vi to use more advanced terminal devices (than TTY). Someone else
wrote a library of graphical interface fuctions called curses to use
termcap. However, since termcap does not bother to implement
anything not used by vi, it has a very limitted capabilities.

X Windows, on the other hand, is HUGE, really really HUGE! You need
virtual memory just to run the thing. The programmer's reference
manual is thicker than most telephone books. In fact, it is so
difficult to use (without motif, anyway) that for 10 years there
were only 4 applications: xterm, xload, xclock and a window manager.

"If the designers of X Windows built cars, there would be no fewer
than five steering wheels hidden about the cockpit, none of which
followed the same principles -- but you'd be able to shift gears
with your car stereo. Useful feature, that." - Marcus Ranum, DEC

4939. 8500 Mac/MagicMac/GFA problem

Newsgroup: comp.sys.atari.programmer
Date: 1997-03-28 00:00:00 UTC
From: Vegard Hofsoy <veg@a.sol.no>
Message-ID: <333B2842.2D9A@a.sol.no>
Source record: 7290

Hi all.

I have a problem I hope someone can help me with:

GFA works _VERY_ unrelyably with the setup in the subject line (MagicMac 2.02, MacOS 7.5.3 revision 2, GFA 3.6TT, A la card 1.4 & I have tried both GFAMASIC & GFA Patch 1.07,96MB RAM). I also tried MagicMacs PCI FPU patch, but it stated that no patch was neccesary...

Programs that I know are OK suddenly throws up a number of exception errors & chrash MagicMac. I have to turn to my old MSTE to get anything done... :-(

Any help? I suspect the problem is related to the fact that the 8500 is a PCI machine, but do not really know what that is... It worked great on the 7100 I used to have.

Bye,
Vegard Hofsoy
[veg@a.sol.no]

Um...Excuse me if I'm missing something obvious, but why do you need to edit NEO_INF.DAT? Why don't you just use the Options->Set Prefs->INF Files dialog? That's what it's there for, after all...

> other than assembly.

It can be done in a higher level language, however, if one inserts a JSR
to an initialisation routine, passing a pointer to the Toolbox info
structure passed to the extension.

If the extension needs to allocate RAM or if anything in the HLL library
needs to be initialised, then the code as presented will need patching.

I wrote the extensions in assembly primarily due to the fact that the
machines that run the code are ram-starved (generally one meg or less). A
HLL extension would gobble up around twice the RAM. And most of the
extensions were hardware level - and I haven't used a HLL that generates
interrupt code fast/clean enough to use at that level.

> the module crash.

I've had limited success changing the parent pointer in the extesnions
basepage to point to the Toolbox basepage. This sometimes allows an
extension to outlive the client app that loads it. But it is not totally
foolproof. Fate has just invented better fools.

> You could argue that modules can be used in a simgle task environment to
> facilitate plug-ins to programs (file filters to load different formats of
> pictures/sounds/text/etc) but a TSR system would miss out on the whole code
> sharing idea.

The client app calls the Toolbox to load "GOOBER.TE". It does so, and
passes back an ID used when calling functions within goober. Client #2
(perhaps a co-resident accessory) finds that goober is loaded (via a
tlbxHasLib call), and uses the ID returned from it to do something, after
calling tlbxUseLib (or should that be tlbxLoadLib, bypassing the physical
loading/initialisation if it already exists, and just passing back an ID)
to inform the Toolbox of one more client that wants to use goober. Both
clients call GOOBER via the toolbox. Neither is aware that another client
is using goober. Only the Toolbox knows how many clients are using Goober.
It could be two. It could be 17.

Only after all clients have called tlbxLibFree(goober_id) will goober
be physically unloaded, and the memory space reclaimed.

> The trick is to make the program that governs your modules (Toolbox
> manager/component manager) a process that is always available.

Done. A TSR is always available. And mine is available to be called via a
redirected TRAP vector. (And it is XBRA compliant, calling the previous
vector holder if/when the API reequirements are not met)

How are you running X-Windows on a 68000 ST? You need at least a 68030 to
run Linux/UNIX which is X-Windows' OS. Don't tell me you're using Minix?!?!

So, are you saying that MS-DOS and Windows are successful because
they are better designed than the competitors?

As I said, I've used lots of different OSes, and almost all of them
were better designed than UNIX (but more expensive and available on
only one platform each).

Go with time. There is no really modern GUI anymore that won't need more
than a megabyte.

You're right considering the time X was developed. But the fact it still
competes well with every other modern GUI tells us we shouldn't call it
just huge for the memory standards at that time, but sophisticated and
far ahead of it's time.

> p > Ask this person where DEC's GUIs are nowadays, ask him where

No, occasionly the worse systems prevail, in this case by acceptance by
the masses. This does not apply to X.

> As I said, I've used lots of different OSes, and almost all of them
> were better designed than UNIX (but more expensive and available on
> only one platform each).

You mean they were user-friendlier to the novice. In that respect you're
certainly right, but that should not be mixed with real qualities, most
notably flexibility and portability.

Cheers Peter

Note that X is portable enough to not require Unix to run on. In fact
there is a well functioning port to MiNT. As I said, a 68000 is a little
to small in terms of CPU power, so it's slow, but it works ! And I saw it
work really well (under MiNT !) with the power of a 68030 !

p > it's time.

I've heard X Windows called a lot of things, but "sophisticated" is
not one of them. Ahead of its time? If so, things do not bode well
for the future.

Woodrow Wilson was also ahead of his time. He was a bigotted
imperialist with a horrible civil rights record, and he was 20 years
before Hitler!

server: What is your Display?
client: display = XOpenDisplay("unix:0");
server: What is your Colormap?
client: cmap = DefaultColormap(display,
DefaultScreen(display));
server: And what is your favorite color?
client: favorite_color = 0; /* black */

/* No, I mean: */

favorite_color = BlackPixel(display,
DefaultScreen(display));

client falls into chasm and dumps core. -- The UNIX-Haters Handbook

Actually, my first X Windows manual used 3 pages of code in order to
open a window in the section on "Getting Started".

dwilga@mtholyoke.edu (Dan Wilga) writes:
> That's right, always use the a7 test. It works under Geneva, MTOS, MagiC
> and, of course, old-TOS.
Erm, the only way to check for being an accessory that was ever documented
by Atari is to check a0, not a7. For programs, it's zero, for accessories,
it points to its basepage.

> IIRC, there may not even be any way
> to truly launch a desk accessory AS a desk accessory from MagiC after
> startup. But I haven't seen later versions of MagiC so I could be wrong
> here.
MagiC >= 4 is able to launch accessories via shel_write() mode 3, but it's not
possible to check for that via appl_getinfo(). That's bad, but the way to
check for supported shel_write()-modes offered by appl_getinfo() is quite
useless, to be honest.

> On the other hand, both Geneva and MTOS use the GEMACC env var in GEM.CNF
> to determine which extensions are treated as DA's. Anything matching the
> extensions is launched as a true DA with the correct (zero) a7.
It would be nice if Geneva would respect the wishes of the programmer when
using shel_write() mode 1. Even if shel_write() gets told that the program
which is to be launched is a TOS program, it runs it as an application, i.e.
the TOSRUN-manager is not used. Only mode 0 behaves correctly by looking at
the program's extension, but that's not always accetable, for example if you
want to start Unix-tools which usually don't have any extension at all.

Ciao

Thomas

Hi everybody,
Does anybody have any ideas about making a rubberbox (just like
graf_rubberbox of aes), but instead of waiting for the call to complete
in order to do other thing, one could have instant access to the current
co-ordinates, and thus, be able to update w,h in real time?

Also, how is the graf_rubberbox implemented in AES? Does anybody know
how to make custom ones?

Thanks,
Nima

THIS ABSOLUTLY IS THE FAIREST AND MOST HONEST WAY TO SHARE WEALTH!!

HELLO!!

Would you like to make thousands of dollars, quick and legally? Than take
5 minutes to read this article, it's going to change our life! What is 5 minutes of the life that you now have. Are you just snoozing,doing the same
old thing? YOU WANT CONTROL OF YOUR LIFE OR GET BACK THE CONTROL YOU ONCE HAD? YOU WANT FINANCIAL FREEDOM????????

THAN YOU SHOULD ABSOLUTLY READ ARTICLE!!! IT'S TRUE!!

You can make up to or over $50,000.00 in 4 to 6 weeks, maybe sooner! Keep reading if you want to take control of your life, if not, than have a great day.

One day I was browsing thru the newsgroups and read an article like this one. Since it that to do with making money, I was courious and decided to give it a try, and this is what it said:
Here we go.

A little while back, I was browsing through these newsgroups, just like you
are now and came across an article similar to this one that said you could
make thousands of dollars in just weeks, with only an initial investment of
$5.00!
So, I thought, "Yeah, right,it's got to be a scam", but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and addresses stated in the article. You then place
your own name and address in the article at the bottom of the list at #5,
and post the article in at least 200 newsgroups (there are over 22,00). So after thinking about it, and talking to my wife about it, who said I was nuts!, what does she know, I'am nuts anyway, I figured what else was I doing, and it's only 5 stamps and $5.00, right? Someone who has tried it says:

"I started receiving money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept
coming in, tripling in size and multipying by 10 -20 times the amount

that I got the first week! In my first week I had made about 30 -40 dollars.
But by the second week, I had made a total of over $1,000.00!!!!!
In the third week, I had over $10,000.00, and it's still growing.
This is my fourth week and I've made about $42,000.00 TOTAL, and the money is still coming in.....". Let me tell how this works and most importantly, why it works.....also make sure you print a copy of the article NOW, so you get the information off of it, and begin making money.
The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 6 seperate pieces of paper and write the following on each sheet of paper.....
" PLEASE PUT ME ON YOUR MAILING LIST."

It is also a good idea to put on that piece of paper the number of persons
who you got the article from. Get five $1 dollar bills and place ONE inside
each piece of paper that you just wrote on,and fold each piece of paper so
the bill will not be seen in the envelope (other wise nosey people who like to steal envelopes with money in it will get yours). Put one paper inside the envelope and seal it.

Do the same for all 5, you should now have 5 envelopes sealed, EACH have a piece of paper and a $1 dollar bill stuffed inside of the paper. Make sure those words that were stated above are on each paper.
This is a service an 100% legal (refer to US CODE Title 18, Section 130& 1342, and Title 39, Section 3005, of the Postal and Lottery Laws).

NOW, BE SURE TO MAIL THE 5 ENVELOPES WITH THE PAPER AND $1.00 TO THE FOLLOWING 5 ADDRESSES:

1. Roland Lafontaine 2233 Jeanne Dr. Hastings Michigan 49058

2. Carl Fodor RD1 Box Y1.E.5 Weirtin W.Va 26062

3. David Zahn 65 E.Washington St No. Attleboro, MA 02760

4. Jean-Louis Pion 44 Seneca St. Cumberland, RI 02864

5. Mathea Skaalvik, Rosenborg gt 31 c, 7014 Trondheim, NORWAY

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, 3 becoming 2, ETC.)
You can slightly alter this article if you need to, editing what you need to edit.

STEP3: Post your amended article (with your name at #5) to at least 200 newsgroups. There are at least 22,000 of them). All you need is say, at least 200.

HOW TO DO THIS:

If you have Netscape 3.0 do EXACTLY the following:
1) Click on any newsgroup like normal, THEN click 'TO NEWS',
which is on the far left when you're at the newsgroups page.
This will bring down a WINDOW to type your message in.

2) Leave the newsgroup WINDOW like it is, CHANGE the subject box
to something flashy like, "NEED CASH" $$$$ or READ HERE $$$$.

3) Tab once and you should be ready to type. Now, retype (only
once)
This whole article WORD FOR WORD, except to insert your name at
#5, and to remove #1 off the list.

4) When you're done typing the Whole article, click on FILE in
THIS WINDOW, RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS
ON THE FIRST WINDOW. Click on SAVE AS when you're under FILE.
Save your article as a text file to your C: or A: drive.
DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU SAVE IT.
ONCE SAVED, move to 5 below.

5) If you still have all of your text, send or post it to this
newsgroup now, by just clicking send, which is right below FILE,
and right above Cc:.

6) Here's where you're going to post all 200.
OK, click on any newsgroup the click on 'TO NEWS', again in the
top left corner. Leave the NEWSGROUPS BOX alone again, put a
flashy subject title in the SUBJECT BOX, hit the TAB once you're
in the body of the message, and then click on ATTACHMENTS, which
is below the SUBJECT BOX. You will get another WINDOW to come
up.
Click on ATTACH FILE, then find YOUR file that you saved; Click
once on the file, and then Click OPEN, now Click OK; if you did
this right, you should see YOUR file name in the attachments
box,
and it will be shaded.

****

IF YOU USE IE EXPLORER IT'S JUST AS EASY...
HOLDING DOWN THE LEFT MOUSE BUTTON HIGHTLIGHT THIS ARTICLE.
THEN PRESS THE "CRTL" KEY AND THE "C" KEY AT THE SAME TIME TO
COPY THIS ARTICLE. THEN PRINT THIS ARTICLE (FOR YOUR RECORDS) TO
HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1 BILLS TO. NEXT
GO
TO THE NEWSGROUPS AND PRESS "POST AN ARTICLE" A WINDOW WILL
OPEN.
TYPE IN YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK IN THE
LARGE WINDOW BELOW. PRESS "CRTL" AND THEN "V" AND THE ARTICLE
WILL
BE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO
AND THEN HIGHTLIGHT AND COPY IT AGAIN. NOW EVERY TIME YOU POST

THE ARTICLE IN A NEWSGROUP, ALL YOU HAVE TO REPEAT "CTRL" AND
"V"
AND PRESS POST.

7) That's it. Each time you do this, all you have to do is type
in a different Newsgroup, so that way, it posts to 200 DIFFERENT
Newsgroups, you see?
Now you just have 199 to go!!
(Don't worry, each one takes about 30 sec.,once you get used to
it)
REMEMBER 200 is the MINIMUM.
The more you post the more money you will make!!!
AND THAT'S IT!!!!

THAT"S THE ONLY 3 STEPS THERE IS!!!!!!!!! You are now in the mail order
business and will start receiving your $1.00 envelopes from vaious
people all over the world within days!!!!!! JUST REMEMBER THE MORE
NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILL MAKE!!!
If you wish to stay anonymous, you can come up with a name, such
as"manager" or "investor". Just make sure all the addresses are CORRECT.
LET ME TELL YOU WHY THIS SYSTEM WORKS SO WELL!!!
Out of every 200 postings, let's say I ONLY receive 5 replies, which is
actually very low. So I made $5.00 with my name at #4.
Now then, each person who just sent me $1.00 makes say only 200
postings,
now with your name at #4, WHICH IS A TOTAL OF 1000 POSTINGS, not
including yours too. Now 50 people send you $1.00; that's $50.00 you
just made! Now then your new 50 agents post 200 each with your name at
#2,
or 10,000 POSTINGS(50x200).
Average return is 500 at $1.00 each is $500.00!!!
And finally, 5,000 people make 200 Postings each with your name at #1.
you now get a return of $50,000.00 before your name drops off the list.
And that's if everyone makes 200 Postings only, and if only 5 persons
respond!!!! When your name is no longer on the list, you just take the
latest posting that is appearing in the Newsgroups, and send out
another $5.00 to the names on the list, putting your name at #6 again.
And start posting again. The most important thing to remember is, to
realize that there are THOUSANDS OF PEOPLE FROM ALL OVER THE WORLD
JOINING THE INTERNET EVERYDAY, THE EXPOSURE IS UNBELIEVABLE!!!!!
So, can YOU afford $5.00 and see if it really works? I did, and I
think you can too.
TAKE CONTROL OF YOUR LIFE AND MAKE SOME REAL MONEY, THIS IS THE
WAY!!!!!!
People have said, "What if the plan is played out and no one sends you
the money?" So what! What are the Chances of that happening when there
are MILLIONS of HONEST USERS AND HONEST PEOPLE who are joining
the Internet and Newsgroups everyday and are willing to give it a try?
Estimates are at 20,000 to 50,000 new users, everyday, with THOUSANDS
of those joining the actual Internet. REMEMBER, play FAIRLY and
HONESTLY and this WILL WORK,

I PROMISE YOU!!! YOU JUST HAVE TO BE HONEST.
Make sure you print this article RIGHT NOW, also, try to keep a list
of everyone that sends you money and always keep an eye on the
newsgroups to make sure everyone is playing fairly. REMEMBER HONESTLY
IS THE BEST POLICY.
YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY!!!!!
GOOD LUCK TO ALL AND PLEASE PLAY FAIRLY AND TOGETHER,
WE WILL PROSPER!!!!!!
**** By the way, if you try to decieve people by posting the messages
with your name on the list and not sending the money to the people
already on the list, you will not get much. Someone who did that
made $150.00, and that's AFTER 7 or 8 weeks!
Then he sent the 5 $1.00 bills, people added him to their lists, and in
4 to 5 weeks, he had received over $10,000.00
THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE
WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT YOUR TIME!!!!!

NOT BAD FOR FINANCIAL FREEDOM!!!!!!!
IF YOU DON'T TRY IT, YOU'LL NEVER KNOW.IT DOES GENUINIELY WORK!!!!!

4956. libvidc porters wanted!

Hi folks,

I've written / write a low level graphic library for RiscBSD which can
be used for writing games/demos on RBSD. The lib also includes CD-Audio
support calls to control a cdrom.

Now I'm looking for programmers which want to port it to RiscOS.
The advantage this has is that all libvidc - based programs will
compile out of the box on all supported platforms.

The main goal is to achive a maximum of speed in drawing, so some
assembler functions would be very apreciated.
Someday in the future support is planed for X-windows and/or other
windows systems.
The lib will be compatible to SVGAlib (Linux/i386) and later to
srgp.

PS: programmer who want to port it to the Amiga, Atari Falcon030, Mac, DOS or
anywhere else are wanted too.

The lib will be BSD-licenced if anyone else then me participates the
development, otherwise I'll release it as shareware-binary-only.

Hi!

I am doing some cgi-programming offline on the good old 68000. It works pretty well except that the implementation of read() in the mintlib I got from hensa (last year?) is not working proper. Of course, I could then just use the normal lattice lib, but then popen() isn't working!?

The problem with read is that I have only one chance to read in the parameters send to the script. On second access on stdin, they are gone. So any pseudo read() using the buffered filesystem will fail.

Any ideas? Related problems?

I think I made it emulate MultiTOS when I wrote this routine oh so long
ago. I'll go back and test, though, to make sure. I agree that it would be
nice to have it use the TOSRUN program if the tos flag is set in the
shel_write() command.

4959. Re: Progs in AUTO or executed by MiNT

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-02 00:00:00 UTC
From: Jens Andreasen <jens-and@dsv.su.se>
Message-ID: <Pine.OSF.3.95.970402210224.10284A-100000@tellus.dsv.su.se>
Source record: 7210

If you run a shell and export some environment variables, they get
inherited by the child processes. But GEM is not a child of any auto.prg,
GEM starts up on its own. That is, unless you boot GEM from your proggie.

If you are under MiNT, you could modify mint.cnf

I'm not going to discuss anything with a "Hater", fanatic prejudices
cannot be discussed.

Actually it's quite normal that you "hate" something doing the first
steps with it. However, I won't allow this feeling to make me abandon the
whole thing, until I've got a reasonable understanding why it is designed
that way. I can well remember how I hated C when I started programming
with it. Nowadays I'm glad that I was stubborn enough to ignore this
feeling for the first million code lines. It wasn't until then that I was
able to appreciate the way it works.

Cheers Peter

4962. Execute GEM program from within GEM program

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-03 00:00:00 UTC
From: josdb@xs4all.nl
Message-ID: <33439f701bffd1@xs4all.nl>
Source record: 7213

Do I have to beware of special things when executing a GEM program from within a GEM program (with Pexec)? The code I have written works flawlessly with .ttp programs, but not entirely with GEM programs. It has (roughly the following form:

```
close_all_windows;

if (!GEM)
{
v_hide_c(handle);
v_enter_cur(handle);
v_clrwk(handle);
v_curhome(handle);
}
menu_bar(MENU,0);

Pexec(0,PROGRAM,COMMAND_STRING,ENVIRONMENT);

if (!GEM)
{
v_exit_cur(handle);
v_show_c(handle,0);
}
menu_bar(MENU,1);

reopen_all_windows;
```

The system hangs during reopen_all_windows when the parent program has more than five windows open. I inserted a form_alert call in the loop, and the first five windows are always restored without problems, but it fails when it comes to the sixth. The funny thing is, it exhibits exactly the same behaviour with the execution of .ttp programs when I add appl_exit(); after menu_bar(MENU,0); and appl_init(); after Pexec();

Am I overlooking something?

>
>How are you running X-Windows on a 68000 ST? You need at least a 68030 to
>run Linux/UNIX which is X-Windows' OS. Don't tell me you're using Minix?!?!

A plain old 68000 ST will run MiNT and MiNTnet with no problems. There
is a MiNT port of the X11 server. I've run MiNT, MiNTnet, X, twm and
xvt on my 4Mbyte STE without problems, but this setup works best as an
X terminal rather than for running applications locally.

4964. 50 MHz / 8 MB Atari to give away

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-03 00:00:00 UTC
From: Marko Haas <unix111@ai.fh-nuernberg.de>
Message-ID: <3343D7D5.2781@ai.fh-nuernberg.de>
Source record: 7215

Hi,

this is for all Atari users who need performance and don't mind an
external power supply.

I want to give away my Atari Mega ST4 for a small amount of money. Over
the last ten years, I added following hardware:

- a 100 MB external SCSI drive
- an ED disk drive (2.88 MB) with Ajax controller
- an ET4000/W32 graphics card
- a 50 MHz accelerator board with
+ a 68030 CPU (the version without internal FPU/MMU)
+ 4 MB fast RAM (plus 4MB on mainboard makes 8 MB)
+ compatibility switch (activates 68000)
+ 68881/68882 socket

Please mail to

unix111@ai.fh-nuernberg.de

or

MarkoHaas@aol.com

Thanks
Marko

4965. Re: Execute GEM program from within GEM program

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-03 00:00:00 UTC
From: dwilga@mtholyoke.edu
Message-ID: <dwilga-0304971205560001@wilga.mtholyoke.edu>
Source record: 7216

I notice that your code fragment says you are closing all of your windows before running the child. If you don't have a multitasking AES, then there is a limit on the number of windows (7 plus the desktop) which can cause problems for the child. You need to use both wind_close() and wind_delete() on your windows before running the child.

But that's not really your problem. I suspect you're hitting a wonderful bug in Atari's AES having to do with the size of the evnt_mesag() queue. When there are more than some number (I believe it's 8) messages pending for an app, the AES starts to get confused. However, this shouldn't happen unless there are already some other messages pending when you go to reopen the windows (which causes one WM_REDRAW event per window).

One thing you might try is this:

```
menu_bar();
evnt_mesag(buffer);
process_event(buffer);
reopen_all_windows();
```

Of course, you could always do this in reopen_all_windows():

```
for each window {
handle = wind_create(whatever);
wind_open(handle);
evnt_mesag(buffer); /* get WM_REDRAW */
process_event(buffer);
}
```

That way, the queue should never get a chance to fill up. But this is slower because of the extra redrawing that occurs.

Source record: 7217

When I edit an old NEODESKH.INF file and rename it to NEODESKC.INF they are sitting side by side. On using the Options->Set Prefs->INF Files dialog to force NEODESK to read the new INF file, the dialog window ONLY shows the older
INF file (NEODESKL NEODESKM NEODESKH).

How can I make NEODESK recognize the new INF file.

Regards
Jan

4967. ST's RS232 DCD signal

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-04 00:00:00 UTC
From: cavey@cavestar.demon.co.uk
Message-ID: <860183589.24765.0@cavestar.demon.co.uk>
Source record: 7218

Hi there,

Could anyone point me to a memory location high up in the dizzy heights of memory where I could read the status of the serial port's DCD line directly? I need to be able to access it from an interrupt handler you see.....

TIA,

Mark.

That's where I put it. evnt_mesag(buffer); after wind_open in the loop
was enough. I don't know exactly what you mean by `process_event', but
it wasn't necessary.

Thanks again!

It depends on the port of course. For Modem 1 DCD is connected to Bit 1
of the MFP general purpose I/O port (DCD = $fffffa01 AND 2).

Cheers Peter

4971. GDOS fonts and bitmap/outline flag

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-05 00:00:00 UTC
From: msbaines@cix.compulink.co.uk
Message-ID: <E86DE2.KCy@cix.compulink.co.uk>
Source record: 7222

Here's a problem I've spent hours on and can only conclude that there is a bug in NVDI or the Lattice C libraries.

If I get a list of the fonts installed on a system and check fontname[32] for the bitmap/outline flag all is OK the first time. Do it again and all the fonts are flagged as outline.
I've used vqt_name() and vqt_f_name() (Lattice C only function?)

A code extract is thus:

```
int main(void)
{
appl_init();

showfonts();/* all OK, bitmap fonts shown as such */
getchar();
showfonts();/* bitmap fonts shown as outline */
getchar();

appl_exit();
return 0;
}

void showfonts(void)
{
char fontname[32];
int workin[11] ={1,1,1,1,1,1,1,1,1,1,2}, workout[57];
int dummy;
short i, handle, type;
unsigned int font_id = 0, totalfonts;

handle = (short)graf_handle(&dummy, &dummy, &dummy, &dummy);
v_opnvwk(workin, &handle, workout);

totalfonts = vst_load_fonts(handle, 0);

printf("Total fonts available: %d\n", totalfonts);
totalfonts++;/* add one to include system font #1 */

for (i = 1; i <= totalfonts; i ++)
{
font_id = vqt_f_name(handle, i, fontname, &type);
printf("%-3u %-5u %d %s %s\n", i, font_id, type,
(type == 1) ? "Outline" : "Bitmap ", fontname);
}
OR
for (i = 1; i <= totalfonts; i ++)
```

```
{
font_id = vqt_name(handle, i, fontname);
fontname[strlen(fontname)] = '\0';
printf("%-3u %-5u %s %s\n", i, font_id,
(fontname[32] == 1) ? "Outline" : "Bitmap ", fontname);
}

vst_unload_fonts(handle, 0);
v_clsvwk(handle);
}
```

The problem sems to be with vst_load_fonts(), I've played with everything there is leaving out some calls, repeating some to no effect.

Anyone come across this problem?
Thanks

Slainte mhath
Mark

Ok Mark, forgive me if I'm wrong, but declaring a string variable 32
bytes long gives you indexes 0 thru 31. fontname[32] is undeclared
and is probably the hi-order byte of something pushed on the stack.

I would declare fontname[35] and see if this doesn't solve your
problem.

John

N > instant access to the current co-ordinates, and thus, be able
N > to update w,h in real time?

You could always hide the mouse (or create an invisible one), call
graf_mkstate() or vsm_locator() repeatedly and draw the box using
v_pline() in XOR mode (drawing it a second time at the same location
deletes the original).

However, to get any sort of speed out of it you should do the
interface in assembly to avoid the overhead of the C bindings. All
my experiments with vsm_locator() were horribly slow.

I suspect that graf_rubberbox() uses LINE A or the equivalent level
display/mouse functions itself.

p > I'm not going to discuss anything with a "Hater", fanatic
p > prejudices cannot be discussed.

I didn't write the book, I just read it. Most of the authors have obvious and sometime silly biases (I recall one going on about how 1 mouse button was better than having 2 or 3), but it serves as a invaluable reference on UNIX bugs, and some of the humor is priceless.

p > I can well remember how I hated C when I started programming
p > with it.

I didn't, and it was something like my 7th language (or 3rd if you lump all assembly languages together). Of course, I still have problems using & where I should use &&... OTOH, I LOVE my Pure C shell (especially "check braces" functions), and it is my second C package (not counting make).

BTW, I knew I was starting to think in C when I got on an elevator and asked someone to press 0.

p > Nowadays I'm glad that I was stubborn enough to ignore this
p > feeling for the first million code lines. It wasn't until then
p > that I was able to appreciate the way it works.

I've always thought that the main reason UNIX has even some devoted fans is that (since the learning curve is so steep) by the time you get good at it, you have invested too much effort to throw it all away again for something better (besides, you can now lord it over all the newbies and enjoy their suffering).

But UNIX isn't just hard to learn, it is also plain bad. For example, the way it handles wildcards is incompatible with any command which uses 2 or more pathnames:

mv *.c subdir/*.c

and kiss your files goodbye. This is a 30 year old bug which will never be fixed as it is too fundamental to how UNIX operates.

This is not to say that there is nothing of value in UNIX, especially as an experiment in distributed development. But it should have been replaced long ago with something better thought out.

Hello,

I'm trying to interface the CPU_MOD.BIN code with C. The BASIC code has
something to the effect of:

```
bload "CPU_MOD.BIN", Cpu_Mod%
call Cpu_Mod, ...
```

I don't know the equivilant of these two calls in C.
The author of CPU_MOD doesn't know C. I'm using Lattice C 5.56, and I don't
know any ASM! :(

Thank You!

That might explain what happened when I did something similar (except with
zip files) on my STFM/4 Mbytes/MiNT 1.12.6. Lost the lot, they appeared to
be appended to one file, except it bore no relation the the individual
files.

Given that MiNT is very Unix like, are there any other killer bugs?

I try to make a shell for the gnu c in accessorie (to be used with Qed). But when i start gcc (it start and work fine) i got some bombs (when gcc end). the bombs don't disturb my acc (it can launch a second compilation), but close the main app. (not only qed, but all apps). it work fine only when the main app is the standart desktop, or when i run my shell in app.

Is there something special about the ttp launch in acc ?
(in the present version, it's a call to Pexec (0 ,....) (whith argv in environment) , but i try Pexec (3,...) ... Pexec (4,....) or Pexec(6,....) and it's the same thing)

Yup, that's the precise algorithm. Nearly identical code is used for
resizing a window, BTW.

>However, to get any sort of speed out of it you should do the
>interface in assembly to avoid the overhead of the C bindings. All
>my experiments with vsm_locator() were horribly slow.

Geneva's routine to do this is in C. The key is to only redraw the lines
when the mouse has actually moved. If you update continually, it's dog
slow.

>I suspect that graf_rubberbox() uses LINE A or the equivalent level
>display/mouse functions itself.

Nope, even Atari's AES uses the VDI for this.

load the binary file "CPU_MOD.BIN" into memory to the address that is
stored in the variable Cpu_Mod%
this simply loads the file into a 80k memory block that was reserved with DIM.
> call Cpu_Mod, ...
jsr's to the cpu_mod routine. arguments are passed on stack as with C:()
so I would suppose
this would work with C if you would use it like a C subroutine.
W means argument has word size
L means argument has 32bit long size
If I remember correctly, the first four values are command,
(zero),mono/stereo, frequenzy (all word size),
then the address of the MOD in memory, and the length, both 32bit long size.
If it does not work, you might try to swap the order of the arguments
(means: last one first and so on).

```
Try this with VDI line thickness = 3 and arrowed end:
-Buffer the last 20 mouse positions
-clip mx-16,my-16,32,32
-restore background if possible
-save background
-draw a line from buffer_x[20],buffer_y[20] to mx,my
and then start over.
```

At least with NVDI, this looks very funny. And don't forget to move your mouse:)
AND don't do this in a GEM application!

```

Memory allocated by an accessory under standard tos does not belong to
the accessory - it belongs to the main application. The other problem
is afaik it has never been documented that an accessory can launch any
program. Only the main application can.

4986. UNIX, the OS from Hell

> mv *.c subdir/*.c
> and kiss your files goodbye.

First of all, I never did it (but it IS something a user might reasonably try). The version of UNIX it was done on used the form

mv source dest source dest ...

There is no way to fix that; the shell doesn't know that mv is expecting a list of pathname pairs, and mv doesn't know that the shell expanded the wildcards into a list of pathnames.

I was't aware that mv had different definitions on different platforms (I guess that's why they call it a standard).

And yes, UNIX is a package INCLUDING everything in /bin. If all you bought was the shell and had to write your own /bin from scratch, you might actually come up with a reasonable command line driven OS (after a few years), but it wouldn't be UNIX. (It would probably still suffer from an obsession with device independent I/O, though.)

The main problem with UNIX is that the commands in /bin were written by many people (mostly grad students) with varying programming abilities, often working in isolation from each other. They don't always parse arguments the same, some are reliable and others very buggy, and the names are often deliberately obscure. For many years there was little effort made to clean up bad commands; one company reported the same bug (and how to fix it) in 3 different releases before they gave up.

As a programming environment, my main complaint was the sheer size of the function library (our documentation was contained in 7 volumes arranged alphabetically, including a 1 volume index, not including X-Windows). There may have been lots of really useful functions in there, but finding them was next to impossible.

At least our workstations had a built-in editor and we didn't have to use vi.

The only bug I know of with the kernel/shell is what happens when you run out of hard disk space (on any partition). At some locations the sysops re-partition the drives on a daily basis to try to keep that from happening.

: mv *.c ~

Now that I think about it, that's it. I was trying to remember what it was that also stood for the user's home directory.

I didn't mention this, but the shell I often use is ksh, the Korn shell. I occasionally run csh for its abilities to change my username while I'm using the online newsreader, tin.

>of CPU_MOD doesn't know C. I'm using Lattice C 5.56, and I don't know
>any ASM! :(

From the little I can remember of Basic Cpu_Mod will be the call
address so you need something like this (error checking omitted) ...

```
main()
{void (*Cpu_Mod)();
int h =Fopen("CPU_MOD.BIN",0);
long n;

/* do bload */
n = Fseek(0,h,SEEK_END);
Cpu_Mod = Malloc(n);
Fseek(0,h,SEEK_BEG);
Fread(h,n,Cpu_Mod);
Fclose(h);

/* do call */
(*Cpu_Mod)();

/* more calls */

/* losing the module */
Mfree(Cpu_Mod);
Cpu_Mod = NULL; /* to denote it no longer valid */
}
```

The above assumes the module is position independant and returns no
results. If it returns a long say, then you would declare "long
(*Cpu_Mod)()" instead.

Also, you will need to cast Malloc() [typically declared as long] to
the required function pointer type. I've never been able to remember
the syntax for this and I have no references handy.

The final problem is the arguments. I'll assume they are passed on the stack (else you'll most likely need an assembler binding) so you (iirc) will need cdecl (or is it _stdargs) preceeding it along the lines of: "void _stdargs (*Cpu_Mod)()". This will stack the arguments right-to-left; if the module expects them left-to-right then unless you have something similar to the MWC "alien" keyword you'll have to resort to assembly again.

Clear as mud eh? <G>

[can't be much clearer without more details]

Just what is a Unix bug? There are bugs in the dozens of different flavours
of Unix, certainly, but there is no one bug common to all of them - unless,
of course, you know different. You can't talk about Unix bugs in the same
way as you would talk about Windows or TOS bugs.

That's a bug in whichever shell happens to damage your files, not Unix
itself. (I know of no shell which will do this, although that's not to say
that none exists.) The distinction between shell and kernel is fundamental
to how Unix operates. It would be perfectly possible to write a Unix shell
which behaves like e.g. DOS and doesn't expand wildcards before passing
argument lists to programs, but that would truly suck. Every single program
which could conceivably take multiple arguments would need to be able to
expand wildcards itself - a tremendous waste of coding effort, not to
mention memory and disk space. If you don't like the fact that the shell
expands wildcards for you, that's just too bad. I don't like the fact that
DOS doesn't.

This has nothing to do with how unix operates, more with which shell you use.
Globbing in ie tcsh or bash is much more powerful than for instance msdog's
cli. It is also consequent and logical. I don't understand your example either.
Why would you want to write it that way under any cli when not changing suffix?

/Christer

> wind_delete() on your windows before running the child.
If you're presuming the use of AES >= 1.4 (i.e. TOS >= 1.4), you may use
wind_new() to get rid of all windows at once. This also takes care of open
accessory windows, which must also be closed before and after running a GEM
application from within another GEM program.

For AESes prior to 1.4, you may use a "dirty" method: Loop from 1 to 7 and
call wind_close() and wind_delete() for that windows. Afterwards, send
AC_CLOSE to all ap_ids from 1 to 6.

Don't use the above method if appl_getinfo() is available and tells you that
wind_get(WF_OWNER, ...) and appl_search() are supported. In that case, you
can use wind_get(WF_OWNER, ...) to close and delete only those windows which
are really open. Afterwards, use appl_search() to get the ap_ids of all
running accessories and send them an AC_CLOSE-message. Note again that this
is only necessary if the AES version is < 1.4, but appl_getinfo() tells you
that the mentioned functions are available. This may be the case for TOS 1.2
with WINX installed, for example.

Even when appl_search() is not available in the above mentioned case, you may
still send AC_CLOSE to the owners of the windows you have closed and deleted.
But only send the message once to each affected application.

Hope that helps ...

Ciao

Thomas

Your comments surprise me. The examples you cite have nothing to do
wit UNIX per se. They have to do with the software that is written on
the basis of the OS. While not totally unfair to equate UNIX with
everything that is traditionally to be found in /bin, it is also
missing the point. There is nothing "fundamental" about how a program
like mv works. In fact, there are many different versions in use
today. I tried your example on two different UNIX machines, and one
ended up with only one file called subdir/?.c, while the other did
nothing but prompt a usage message:

```
mv *.c subdir/*.c
usage: mv [-if] f1 f2 or mv [-if] f1 ... fn d1 (`fn' is a file or directory)
```

It stands to reason, of course. Besides, from a programmer's point of
view it doesn't matter what is or is not in /bin. Of course, you could
make it easy on yourself and use system("mv ..."); if you want to move
a file, or system("ls ..."); if you want to read a directory, but that
is not the proper way to go about it. The OS is superb, a joy for
every programmer - if I may say so.

Not quite. I do something like this all the time. However, you entered the command wrong.

mv *.c subdir

will send it to the right place. I've always done it slightly different.

mv *.c $HOME

or

mv *.c /tmp/files

does it every time. To explain to others what the $HOME is, it's a variable that holds your home directory. Mine is /home/rsg0910. Saves loads of typing when I mv * $HOME, to move stuff from the temporary directory I'm in to my home account.

Once I made the mistake of doing an 'rm *' in my home directory. You can guess the rest. Fortunately, I didn't lose too much since that command didn't delete the directories. However, an 'rm -rf *' will.

But of course, Unix can be hard to learn if you aren't willing to learn. A shell account can do wonders for your learning at times. There's a few good books out there that will help.

I've also been on the VAX systems. Both operating systems have their quirks, but they're useful to some extent.

I mainly hated it because it's philosophy wasn't clear to me. Took me
ages to figure out the difference between
char d1[] = "abc";
char *d2 = "abc";
strcpy (d3, "abc");
and caused lots of crashed in my early programs which were really hard to
find. Apart from that, the compilers were stupidly buggy at the time, and
coping with Alcyon C' or Megamax C's bugs is not a newbie's thing to do.
Turbo C didn't exist at the time.

It simply is not a bug. It is a straight consequence of the shell
philosophy under Unix. You _think_ it's a bug because you're used
to a slightly different meaning of wildcards under other OS. Probably
nobody ever had called it a bug if not the '*' had been used, but some
other character, because then it's obvious there is a difference.

If you wanna start using a different OS than the one you're used to, it's
essential to free your mind and throw every habit overboard you learned
from the earlier OS. This of course becomes increasingly more difficult
while you improve your skills in handling that earlier OS. If you'd done
that then it had never occured to you to think "Yeah, that '*' is a wildcard,
thus 'mv *.c subdir/*.c' must work."

> This is not to say that there is nothing of value in UNIX,
> especially as an experiment in distributed development. But it
> should have been replaced long ago with something better thought out.

So you're saying the millions of people that put their thoughts into Unix
were not capable of doing it right ? Isn't that a little presumptuous ?
And under that attitude, how do you explain the recent success of Linux ?

Cheers Peter

Pexec() from a DA was never officially supported until MultiTOS. While it does work to execute a 100% TOS program, you will get a crash if the program does even so much as an appl_init(). No AES calls at all can be used in the child. I don't use GCC; perhaps this is the reason for the crash.

As it turns out, wind_new() has a bug of its own: Under TOS 1.4, the first window opened after a wind_new() doesn't respond to mouse clicks under certain conditions. You have to fake it out by briefly opening a small window offscreen.

The problem with sending AC_CLOSE to DA's is that there are a good number of them which really do check to see that word[3] of the buffer actually contains the menu identifier of the DA. And there's no way short of intercepting all menu_register() calls to know this value.

While sending AC_CLOSE without the ID is still better than not sending it at all, it's not perfect. Why not just do an appl_exit()? That always sends AC_CLOSE properly to all DA's, and it even closes the windows for

you. (This assumes singletasking AES, of course.)

Oh? Under what conditions? I couldn't reproduce the bug.

I tried appl_exit(), but it doesn't close ACC windows (under TOS/AES
1.4).

That's great. Thanks for the information. The function wind_new was
there all the time for me to use, but I wasn't aware of it :) It is
especially nice, because it _does_ take care of accessory windows,
unlike appl_exit();

>For AESes prior to 1.4, you may use a "dirty" method: Loop from 1 to 7 and

Hm. I have PureC 1.0 and there's no appl_getinfo().

Another question (since you know so much): Is there a way, under TOS
(and AES) 1.4, to find out which window is currently at the bottom?

It's rather unfair to call this a bug - it just means that you have not
understood how the shell handles wild cards. Remember, unix does not
stop you doing stupid things, since this would stop you doing clever things.
It would be quite possible to write a shell in which the above command
behaved in the way that you expect it to. On the other hand, you could do:

mv *.c subdir

from any normal shell, which results in the required behaviour. (As long
as subdir already exists as a directory.)

>Given that MiNT is very Unix like, are there any other killer bugs?

Watch out for 'rm -rf *' !

Really, there are lots of 'gotchas' on a unix-like system which, for
quite logical (and sometimes illogical) reasons, don't behave as one might
expect. A basic book introducing unix concepts is invaluable. You might
also try the comp.unix.questions FAQ.

Hi!

Can anybody tell me what's wrong with the following piece of code?

if (appl_find("V-CONFIG") < 0)
Pexec(100,"V-CONFIG.PRG","",NULL);

It looks OK, but when the child exits it leaves a "empty" process,
with size 0 and status EXIT. These processes goes away as soon as the
parent exits. I don't know much about how GEMDOS launches programs,
but it looks almost like the basepage isn't freed until the
parent/caller exits. There's nothing in the Atari Compendium that
indicates that the caller must do someting like this in mode 100?

BTW. I', running MiNT 1.14 and N.AES 1.1.

I'm using an atari 1040st for the sequencing program Cubase. While I was trying to make a copy of Cubase for a friend, suddenly a tos error#34 message appeared on the screen. I can't start Cubase anymore but other programs are still running, although they seem a bit slow. Also, starting up my computer has slowed down a bit.

Is my Cubase disc just damaged, or are the problems more serious? Any suggestions?

Thanks, jj

I think the tos.h comes from TurboC/PureC and is therefore copyrighted.
Try to find any other libc (MiNTLib, Sozobon's libc...) on ftp and get
osbind.h, maybe tos.h. These should hold the defines.

For aes.h and vdi.h I would recommend you get the gemfast-library and take
aesfast.h, gemfast.h, aesbind.h and vdibind.h as replacements. They will
work, at least if you define the TurboC-compatibility macro before
including gemfast.h.

Sorry, this is just for the sources. To understand what the library
functions do you should get one of the popular hypertexts. Have a look on
ftp for subdirectories "info", "hypertext", ... Maybe somebody else can
point you out particular documents, I can't...

Ciao

Guido

If it is not found you need to set the path to the program.
With your code the program you are starting must be in the same path as
your own program was started from.
Then it is good to know the process-id of the process
it is good to know for killing the process or knowing when it terminates.
To not get problems with minix filesystem use lowercase in filenames.

Example:

if (appl_find("V-CONFIG") < 0)
{
pid = Pexec(100,"C:\\v-config.prg","",NULL);
if(pid <= 0)
{
printf("Error ... \n");
}
}

I'm at complete loss with this problem, and desperately need help :)

I want to display some text in a window, and reverse image any lines that the user drags the mouse over. ie. like in a text editor..

I know how to display the text using v_gtext, but am at a complete loss as to how to reverse image it.

How do you do this? What VDI opcodes should I be using?

TIA, Gary

- Obtain the rectangle into which your displayed text is contained.
- Draw a black rectangle at the same place in XOR mode.

That's it.

Regards.

The "empty" processes (the official name is "zombie" processes :-))
are placeholders in MiNT's process table that keep around statistics
about the processes (exit code, resource usage, etc.). Many parent
programs wish to be able to gather such information, which is
done with the various Pwait*() system calls.

There are three ways to solve your problems:

(1) use Pwait() to collect the information; or
(2) use Psignal(SIGCHLD, SIG_IGN) to indicate to MiNT that your program
doesn't care about child exit statuses; in this case the zombie
processes are never created (this may be the easiest solution for you)
(3) use shel_write() to create the processes rather than Pexec(); then
collecting exit statuses is the AES's problem. This will only
work with MultiTOS and similar multitasking AESes.

5013. CAB v2.0 - frames

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-11 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <5b4_9704111525@conchbbs.com>
Source record: 7064

It should be fairly easy to write a frames manager within a GEM window. The GEM window frame is simply an object tree. You could add another object tree inside the GEM window frame to handle the multiple slide bars, etc.

The frame manager must intercept mouse button events which hit on the frame object tree, and may in turn generate redraw and slider events for specific frames. I believe you can use appl_write() to send messages to yourself, so the only problem would be inventing a new message type (WM_FRAME) and the 8 message limit on the AES queu.

OTOH, you could just make the code Geneva specific.

It's done in two steps: First, write the text normally. Second, XOR
a solid black bar over it.

josdb@xs4all.nl (Jos den Bekker) said:-

>Hm. I have PureC 1.0 and there's no appl_getinfo().

It should be possible to write your own with a bit of assembly. Here's
the one I did for Mark Williams C ...

```
#include <crysbind.h>

extern unsigned short int_in[I_SIZE],
int_out[O_SIZE];

short appl_getinfo(ap_gtype, ap_gout1, ap_gout2, ap_gout3, ap_gout4)
short ap_gtype;
short *ap_gout1,
*ap_gout2,
*ap_gout3,
*ap_gout4;
{
int_in[0] = ap_gtype;
int_out[0] = crys_if( APPL_GETINFO );
*ap_gout1 = int_out[1];
*ap_gout2 = int_out[2];
*ap_gout3 = int_out[3];
*ap_gout4 = int_out[4];
return int_out[0];
}
```

Naturally, you won't be able to copy this verbatim (due to crys_if()
probably) but it shows the general idea.

This is called a zombie process. You have to set up a signal handler to catch signal SIG_CHILD. The easyest way to do this is to so something like Psignal(SIG_CHILD, SIG_IGNORE) -- it's something liek that. Look in the Atari Compendium under the GEMDOS/MiNT 'Psignal()' sort of area and you'll find the one you need. All you have to do is make your process ignore the SIG_CHILD signal.

: There's nothing in the Atari Compendium that
: indicates that the caller must do someting like this in mode 100?

It's not easily found -- look under Pwaidpid() and other associated calls (they are all together since they are in aplhabetical order). From this you can find out why zombie processes exist: when a child process terminates, MiNT holds the process structure in memory until the parent has been given the child's exit code. The various different Pwaidpid() calls can check for any temrinated children, stopped children, etc... There is a variant that checks only for a particular child.

Come to think of it... I may be wrong about having to simply ignore the SIG_CHILD signal (it is sent whenever a child process terminates). You may have to setup a signal handler that does a Pwaidpid()... Best bet is to check the compendium.

Hope this is of some help.

Cheers,

James Cox.

The problem is not to start the child, but to get it to exit properly.
Somebody suggested that I'd use shel_write() instead, perhaps that
works better.

>To not get problems with minix filesystem use lowercase in filenames.

A good tip, but it's not necessary when the program runs in the
TOS-domain. However, mine is running in the MINT-domain so perhaps I
should do this...

Hi To all on csap

I'm a bit new to this programming malarky, and am starting off by doing a resource code translation from German to English. I've got ORCS, and although it is dead easy to use it is fouling up on one of the menu items....It's a PCB CAD package, and it has a list of active and displayed layers as part of a pull-down menu. These layers, numbered from 1 to 8 are normally all on the same line, however the mere act of opening the .RSC with ORCS changed that to one number per line, as the layer menu has these numbers on about four times, this took the menu off the bottom of the screen.....Can anyone recommend anything as easy to use as ORCS which might not do this...I'mm going to go through my CDROM collection tonight looking and testing, but any ideas would be welcome....Please reply via email, my newsgroup access can be a bit flaky at the best of times...

I do this now, but the child's PID isn't equal to the PID returned by
Pexec(). Right now I just do it like this:

pppd_pid=Pexec(100, "u:/usr/etc/pppd", "", NULL)+1;

It works, but how "legal" is this?

>(2) use Psignal(SIGCHLD, SIG_IGN) to indicate to MiNT that your program
> doesn't care about child exit statuses; in this case the zombie

This would be the best solution, but I can't get it to work! If I use
Psignal as suggested, I get a "Type mismatch in parameter
'handler'..." error when I try to compile. I'm using Pure C 1.1.

>(3) use shel_write() to create the processes rather than Pexec(); then

I did this in another project I'm working on, and it worked
perfectly :-)

Hey Everyone!

Here is a benchtest program that I wrote. It should work on just about
everyone's machine, especially Macs running MagiC...

CHECK IT OUT!!! I AM HOPING TO GET A LOT OF FEEDBACK!!!

I would like to post a database of as many different hardware and
software combinations as possible. Please let me know any bugs, etc.
Further instructions are in the READ.ME and the program itself...

I would love to see results from a Hades...

What about the MiNT/MiNT-net port of X11r5? That worked ok on a standard
ST with 4mb, IIRC...

Every time I try and use the VDI call v_get_pixel the values returned
are always 0!! I'm declaring things like this:

```
short vgp,vgc;

v_get_pixel(vhandle,x,y,&vgp,&vgc);
```

It always returns vgp and vgc as 0 :-(

any help would be appreciated...

5029. Problem with Riebel-Ethernet card

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-14 00:00:00 UTC
From: mp@rob.cs.tu-bs.de
Message-ID: <mp.861018414@rob.cs.tu-bs.de>
Source record: 7080

Hello, I have a problem:
Just recently I bought a Ethernet card for Mega-ST
(Riebel Card without Battery). First it turned out, that DC/DC converter
was broken. Ok, I fixed that.

My Problem: I cannot ftp to another machine.
The error message is: no more sessions.

But I can (without problem)
- ping to another machine
- telnet to another machine (after some time)
- ping from another machine (to ST)
- ftp from another machine (with login into ST)

Therefore I think, HW and connection seems to be ok.
This sounds like a configuration problem to me.

My configuration:
Mega ST (4 MB),
Hypercache disabled
Riebel Card (without Battery)
Interconnect Software Rev 1.6
the other computer: NeXTStation

Any idea?
Thank you in advance
Martin

MiNT, that's the key here. If you have launched a child, you need to catch the SIGCHLD signal and use Pwait() to get its return status. Otherwise, it will continue to be listed as a "zombie". There's also a way to turn off SIGCHLD (with Psigmask(), if memory serves me. I'm probably wrong here, though.)

I remember encountering this same problem years ago when I first started writing Geneva. It was so counter-intuitive for this to be on by default (or so it seems to me anyway) that I had to call Eric Smith, who was still working at Atari at the time, to ask him the same question.

Not very legal at all... perhaps the Pure C binding for Pexec is broken?
It should be returning the process id, not the process id - 1.

Try casting SIG_IGN to the appropriate type (which you should be able
to determine by looking at your compiler's "mintbind.h" file.
E.g. something like:
Psignal(SIGCHLD, (long) SIG_IGN)
may work.

Everyone,

Sorry about posting my program to this and the other two Atari newsgroups. I have been living in a vacuum over here in the U.S. and I do not have much experience with the internet. I have been programming on my own over here since 1989 and I think I have quite a few good ideas for the Atari and MagiC. Also, I think I could help out with many GFA problems people have because I've had to figure many of them out for myself.

COULD ANYONE PLEASE tell me how to remove my BENCHTEST posts and tell me the CORRECT way to give my program out to anyone that's interested. Until I wrote this program, I had no idea, for example, which of my accessories was slowing down my computer and by how much. I could also see which area were slowed and which were accelerated...

Thanks,

Rob

I don't think you can remove your posts to a newsgroup (could be
wrong...I know that *I* don't know how to do it <g>). I wouldn't worry
about it, it wasn't such a big posting.

I believe there's an atari.binaries newsgroup but you'd need to get
confirmation from someone other than myself.

BTW, I would welocme someone with GFA experience here...I thought I was
the only one using GFA in this newgroup!

Your call looks correct. The only explanation I can think of is a bad binding
of your compiler for v_get_pixel().
Sorry for not being very helpful.

From: allfree@bbs.cruzio.com
Message-ID: <E8oqJo.1Lz@cruzio.com>
Source record: 7088

```
Hi,

I'm having trouble with Lattice C's "Default Short Integers" option on
its compiler. This code:

main()
{
char c = -1;

printf("%d\n", c);
}

...seems to print '-1' when I'm in normal, 4-byte-integer mode, but when
I change to short integers, it prints -65535, or worse, seemingly any other
number it thinks of! I can see how -65535 has a certain logic to it, but what
about results such as 1, or 3, or 2, which I've also gotten?

If anybody can help with this, I'd appreciate it greatly! I'm trying to
get some solid C code for the CPU_MOD ASM routine, but it's difficult to check
for an error code of -1 when Lattice isn't handling -1 correctly!

Ben Allfree
allfree@cruzio.com
```

Pexec returns the pid of the zombie-process, the actual process (pppd)
has pid+1, and a ppid of 000.

Folks, I need some help.

How on earth are one to write and change environment variables under
plain TOS/GEM. When MiNT is running it is possible to use the
shel_write() function, but this is not available under TOS/GEM.
Is there any GEM calls available for this kind of task or do I have to go
direclty on the hardware address?

Regards, Thomas

>Pexec returns the pid of the zombie-process, the actual process (pppd)
>has pid+1, and a ppid of 000.

Ah, I know what's going on. /usr/etc/pppd is forking itself and then
running yet another process. Here's the sequence:

your program: Pexec(100)...
-> pppd 1 (process id "pppd_pid"): fork() to create "pppd 2"
-> "pppd 1": exit() (leaves a zombie with process id "pppd_pid")
-> "pppd 2" (process id "pppd_pid + 1"): runs in background

You do *not* want to add 1 to the pid you got back from Pexec. Use it
directly in the Pwait() call so that you can collect the exit status of
the child that turned into a zombie. The other process (which is actually
your process's grandchild) doesn't need to be "waited" for -- this
is indicated by its ppid being 0.

In fact, in this particular case there's no need for you to use Pexec(100);
pppd uses fork() to put a copy of itself in the background, so
Pexec(0) will work just fine (and will save you the trouble of having to
do a Pwait()).

If there are other programs (other than pppd) that you might want to run,
you can still use Pexec(100) + Pwait(), but do *not* add 1 to the pid you
got back; you really do need to do Pwait() on the zombie process to
get rid of it.

5042. Speeding Up graphics

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-15 00:00:00 UTC
From: sammcgee@crl.com
Message-ID: <5j1h36$4vc@crl2.crl.com>
Source record: 7093

I ran some benchmarks for different operations to speed up my HiSoft BASIC programs. The following list shows the execution times (in seconds) for a loop with each operation. (about 64000 times)

TIME OPERATION
5.78 SQR
5.06 DIV
0.41 >> <<
0.38 MULT
0.32 SUB
0.25 ADD

What's interesting here is that division is 13 times slower than multiplication. In fact it is closer to square root than anything else. Why?

Then I changed the global variable declaration using DEFINT a-z, DEFDBL, DEFSNG, and DEFLNG. The first column shows the time using DEFxxx. In the second column only one variable was changed in the loop while the loop itself was integer.(ie FOR x%=1 TO 10000:x#=x#:NEXT x%)

DEFxxx Single Var Type
3.63 String (for reference)
14.13 0.33 Double float
1.30 0.22 Single float
0.42 0.21 Double Integer
0.20 0.20 Integer

I guess this shows that for speed minimal use of single precision floating point isn't bad but it shouldn't be used in frequently called loops. Double precision is a killer. (when talking about speed)

This exercise is of course to speed up graphics. I came to the conclusion to use integers to represent X and Y coordinates multiplied by 50. Then I can do slight increments and divide the results by 50 to get the coordinates back. This seemed to work great until I found how slow division was. Then I thought to use the shift bits left and right operators (<< , >>) to do multiply and divide. But I'm then stuck with the X-coordinate times 32 or <<5 because 32767/640<51.2.

What I mean is that the greatest integer value(32767) divided by the largest coordinate(640) is my multiplier. For me to use >> and << the multiplier must be a power of two. The greatest power of two less than 51.2 is 32 or 2^5. I could use the sign bit and then I get 65536/640<102.4 and the multiplier would be 64 or 2^6. Better resolution.

Any comments would be useful. (with code examples, any language)

5044. XBRA

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-16 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4107cd$11351.292@HERMES>
Source record: 7095

In the course of debugging the disambiguator/dispatcher of my Toolbox DLL manager, I have run up against a few hurdles.

If a function call is not allowed in the current Toolbox implementation, (for example the API magic numbers were incorrect, the 16 bit library number or 16 bit library function number are invalid/unimplemented) I want to use the XBRA protocol to call the previous holder of the TRAP vector I use (TRAP number 0, vector $20, exception table offset $80).

However, if this was pointing into a ROM or disc loaded TOS, this will lead to a stream of 32 bombs appearing on the screen, and the calling app to be terminated.

Is there a foolproof way of detecting whether the TRAP vector is pointing into TOS, or has been grabbed by a debugger or other app?

In general, I use the following algorithm when deciding whether to XBRA:

```
address = previous holder of trap vector
if address >= $00E00000 AND address < $01000000 then
it is pointing to the TOS ROM "bomb generator"
do not XBRA to it
else if it points to a previous toolbox
XBRA to it
else
who knows?
end if
```

Hisoft's MON (as supplied with Devpac 3.1, Lattice C 5.60, and probably some of their other products) reprograms "illegal" trap vectors to point into itself. Is there an easy way to detect it (and other) debuggers/bomb handlers?

As an example of using the Toolbox to call function $259 in library 3, and pass the value $12345678 to it, the API call would be:

```
move.l #$12345678,-(sp) ; parameter
move.w #$0259,-(sp) ; function number within library
move.w libnum3,-(sp) ; library number
move.l #0,d0 ; API (required)
move.l #$10,d1 ; API magic (required)
move.l d0,a0 ; API (required)
move.l d0,a1 ; API (required)
trap #0 ; call the Toolbox
add.l #2+2+4,sp ; fix the stack
```

It is deemed to be a Toolbox call if the four "scratch" registers are set up as zero in D0, A0 and A1 and 16 ($10) in D1. I generally found that it is somewhat unlikely that those registers are going to be in that state when the TRAP #0 handler is called, and now require this as part of the API. There were a few variations in calling sequence and magic numbers earlier on in it's life, but, TTBOMK, none of those were ever released to my beta testers or the users of my custom apps which used the Toolbox and it's Plug-ins or Extensions.

We assume the variable "libnum3" has been initialised with the right value prior to the call. This can be found by calling the library enumeration functions within the Toolbox, or the tlbxHasLib function, and passing the 32-bit "cookie" identifier of the library we are interested in and the return value will be -1 (n/a) or the 16 bit library number.

(The library number is relevant to this session only, and may be different next time. The only pre-known library number which can be relied upon is library number zero - The Toolbox itself)

The Toolbox can currently be detected via XBIOS function $7462. If the return value is $7462 you have no Toolbox. If it returns $544C4258, then it exists.

Are you sure that you have linked your program with the correct library?
Compiling with the short integers option is one thing, linking another one.
Lattice comes with many different libraries, corresponding to the same library
code compiled with different options. You can distinguish between libraries
by their names, see the docs.

Imagine that if you link your main() routine compiled in short integers with
a printf() expecting long integers, this is not going to work...

This is most probably the cause of your problem.

> shel_write() function, but this is not available under TOS/GEM.
shel_write() has nothing to do with MiNT, as it's an AES call. Don't mix
it with the availability of the extended shel_write() call in MultiTOS,
which is also available in Geneva and MagiC, which both don't require
MiNT to run.

> Is there any GEM calls available for this kind of task or do I have to go
> direclty on the hardware address?
There's no AES call to change environment variables, as the AES has its
own environment not necessarily identical to the one the current program
uses. This AES environment shouldn't be changed from an application,
anyway, as it would affect all other applications.

If you want to give a program you want to run from within your
application its own environment variables, there are two ways:

1. Don't use shel_write(), but Pexec() (which you'll need to use for
SingleTOS anyway if you want to keep the calling program running).
Pexec() allows you to pass a pointer to an environemnt.

2. Modify your program's environment (create a copy of the old one,
modify the copy and let p_env of your program's basepage point to it) and
then use shel_write(). Note that this won't work if you use it with the
shel_write() you find in SingleTOS, as it requires to quit the calling
application before the "child" (which is more like a "brother" or
"sister" in that case ;) is run, so the modified environment will not be
used.

Also note that some C-compilers offer the call "setenv", which will ease
the modification of the environment.

Ciao

>
> What's interesting here is that division is 13 times slower than
> multiplication. In fact it is closer to square root than anything
> else. Why?
Because division is quite "expensive". Try to write your own
multiplication routines which multiply two numbers by only using
addition, substraction, bit manipulation and shifting. And then try the same
with division, and you'll see.

You can do all multiplications by splitting one factor in its powers of
two:

```
x * 29 = x * 16 + x * 8 + x * 4 + x * 1
x * 34 = x * 32 + x * 2
```

So multiplying is (mostly) a matter of fast shift- and add-operations.

Unfortunately, this doesn't work for division:

```
x / 29 != x / 16 - x / 8 - x / 4 - x / 1
```

There are algorithms for division which also only need "basic"
operations, but they need a lot more of them than multiplication - that's
why it's so much slower. (Of course, the relation between division and
multiplication strongly depends on which algorithms are used.)

>
> Any comments would be useful. (with code examples, any language)
If you don't mind using assembly language, you could use "fixed floats",
i.e. longs (32 bit) where the upper word represents the integer part, and
the lower word the fractional part. I.e. 1.5 would be 0x00018000.

To make a "fixed float" out of normal float variable, simply multiply with 65536 (i.e. 16 shifts to the left). Do the opposite to get the float value back out of such a number.

You can directly add and subtract these "float longs". To multiply two numbers, you have to do a 64-bit multiplication (the reason why you need (or better use) assembly language) and take with middle long out of the result. I.e. 1.5 * 1.5 would be 0x00018000 * 0x00018000, this results in 0x0000000240000000. The middle 32 bits of that are 0x00024000, which is 2.25, the result of 1.5 * 1.5.

Division is a bit more tricky, and I don't have the actual algorithm here. Division by powers of two is easy, of course. Unfortunately, you can't divide by x by splitting x in its powers of two and divide by them, as it's possible for multiplication (see above).

Please excuse me if that's of no use for you.

>get rid of it.

This solves one problem, but creates another... I need to know the pid
of pppd in order to...

a) Check that pppd is still running.
b) Kill it when the on-line session is over.

When I use...

```
pppd_pid=Pexec(100,"/usr/etc/pppd","",NULL)+1;
Pwait();
```

... I get pppd's pid, this has worked fine so far. But of course, if
another process is started after pppd and before pppd forks() this
will break.

I solved this another way, by starting pppd in the background
(Pexec(100...)) with the parameter "-detach", which prevents it from
forking itself. I then used Pwaitpid() to periodically check that it
still runs.

But how do I get a process' pid? Are there any calls (Like appl_find()
or appl_search() for AES-processes.) that I can use? I tried to browse
the Atari Compendium, but it's so poorly laid-out that it takes
something like 10 minutes to format the gemdos-reference with CAB 1.5
on my 24MHz Falcon...

5049. How to read the 200Hz system-clock?

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-16 00:00:00 UTC
From: josk@ifi.ntnu.no
Message-ID: <3354fe085b352@ifi.ntnu.no>
Source record: 7100

Hi!

I need to make an accurate clock, and I thought that the 200Hz system-clock would be the best source. The Pure C helpfile says that clock() (In time.h) returns this value, while K&R says it returns the time used by the calling process. After having tried clock(), I believe K&R are right here.

So I tried to read the clock directly...

```
long *timerptr, timer;

timerptr=0x4ba; /* The 200Hz system-clock is located here */

Super(0);
timer=*timerptr;
Super(0);
```

However, timer is always 0. I'm obviously doing someting very wrong here, as I'm not quite familiar with how C's pointers work.

```
a > I'm having trouble with Lattice C's "Default Short Integers"
a > option on its compiler.

a > printf("%d\n", c);

Variable argument lists, such as used by printf(), convert some
variables (e.g. float to double) before passing them on the stack.
Evidently when using long ints, Lattice C converts shorts to longs,
but not when using short ints.

If printf() is expecting a long and you send it a short, bad things
can happen: -65335 = (-1 << 16) + 0 where the 0 just happened to be
on the stack in the next slot. Just be glad you didn't have any
more arguments in the call (especially string pointers)

As someone else has already posted, you need to link in a version of
printf() which uses short ints.

5051. Fonts

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-16 00:00:00 UTC
From: msbaines@cix.compulink.co.uk
Message-ID: <E8qrGM.7BE@cix.compulink.co.uk>
Source record: 7102

I want to display a list of fonts currently installed by the system.
Not all those available on disk, but those installed in the ASSIGN.SYS file
or made available via NVDI etc at bootup.

My present code appears to work with NVDI 3+ but fails on bitmap only GDOSs.
Something like:

```
totalfonts = vst_load_fonts(handle, 0);

printf("Total fonts available: %d\n", totalfonts);
totalfonts++;

for (i = 1; i <= totalfonts; i ++)
{
font_id = vqt_name(handle, i, fontname);
printf("%-3u %-5u %s\n", i, font_id, fontname);
}
vst_unload_fonts(handle, 0);
```

I try to list the fonts by getting the total number via vst_load_fonts() but
this fails under ordinary GDOS 1.1 for instance, returning zero.

So how do I know how many fonts there are?

I also tried
```
for (i = 2, font_id != 1; i ++)
```

on the basis that when vqt_name fails it returns a font_id of 1 any way
which is the system font, so we start at a font above that, hence i = 2.
All I get with this is the system font but works on NVDI 3.

So, can someone lead me through the procedures to list the installed fonts
that works with *all* GDOS versions please?

sorry, I was a bit misleading there. Most of the shel_write() functions
is only available with AES 4.0 and above.. which includes MiNT amongst
others.

> There's no AES call to change environment variables, as the AES has its

What I want to do is write a small CPX that allows chaning the _GLOBAL_
environment variables, as the CPX I have for this now is way to buggy. I
am not interested in the environment for the executed task but the one
that is defined as global. You see my need here?

> If you want to give a program you want to run from within your
> application its own environment variables, there are two ways:

As I've staded above this is not what I need. I need to have a way of
accessing the environment vars as other programs like AUTOENVR, ENV.CPX,
and quite a few others do. I am going to set the environment for GEM!

> Also note that some C-compilers offer the call "setenv", which will ease

Not much use when coding in assembly is it? :)

AFAIK C should automatically convert the char you are using into an the
default int used, when you're using %d in printf.

If this is not the case, you might want to write:

printf("%d\n", (int)c);

or maybe

printf("%d\n", (short int)c);

I'm not sure if any of this helps... oh well...

Greetings,

Tomas

Well, if you know the name of the process, *and* you know that no other
process with the same name can be running, then you can look in the
U:\PROC directory, e.g. with an Fsfirst() for U:\\PROC\\PPPD.*. The
file extension (3 characters) will be the process id, e.g. for
the program C:\USR\BIN\FOO.TTP, with process id 180, U:\PROC will contain
a "FOO.180" entry.

Good enough. If you have two processes with identical names running,
there's no practical way of distinguish them without knowing the pid
anyway.

Just curios: What happens with pid 1000? I'm running pid 682 now,
perhaps I should stay up a couple of hours more and see what
happens...

Another idea might be that he's using 32 bit ints and the compiler expects
vgp and vgc to be of type int. That would cause both shorts to be zero.

IIRC, the GCC libraries sometimes use 'int' as a type, regardless of whether
those are 16 bit or 32 bit. The actual library routines then make things
appear correctly to TOS. Any pointers you supply must be to ints, though.

Check the docs of pppd which should tell you the name of the file where it
will write out its pid (perhaps in /var/run/pppd.pid).

I don't think this is a problem. If the magic numbers are not correct,
then apparently this was a wild call to trap #0 and you should forward it
(with all possible consequences, it's the application's fault anyway). If
the magic numbers are correct, but the function number isn't recognized,
you should perhaps print a warning and return some error indicator without
forwarding the call. This should then be handled in a graceful manner by
the application's binding for your toolbox.

That should have worked, except that you should definitely not be doing
Super(0) the second time around (you should be using the return value from
the first Super(0) call). It's actually a little easier to use the
Supexec() function, IMHO:

```
long get_timer(void) {
return *(long *)0x4ba;
}

main {
long timer = Supexec( get_timer );
}
```

> others.
Geneva does not need MiNT and has the extended shel_write() modes and
features, and MagiC also has most of them implemented.

> What I want to do is write a small CPX that allows chaning the _GLOBAL_
> environment variables, as the CPX I have for this now is way to buggy. I
> am not interested in the environment for the executed task but the one
> that is defined as global. You see my need here?
OK. That's a bit tricky. The best method would be to have an auto-folder
program like Senf which not only sets initial environment variables for the
AES, but also installs a cookie pointing to the basepage of the AES
process. The CPX could then use (basepage)->p_env to access and
manipulate the global environment.

But don't forget that in most cases this won't have any effect if not the
built-in desktop is used, as other desktops have to use Pexec() to launch
programs. And there are very little programs which use shel_envrn() to
read environment variables, which they would have to use in this case to
read the environment set up by the CPX.

> Not much use when coding in assembly is it? :)
Not really. But it's not my fault if you're doing everything in assembly
language ;)

Ciao

Thomas

>I worked fine on TOS 4.04... Ideas?

Hi John,
Have you tried using ORCS?...I know it's a bit crude and you sometimes have to tell it a menu is a formfield if you don't want it to chew up the file format, and then change back when you finish, but it's a fairly easy program to work with, I've used it to translate German RSC's into English, and I never even read the README.....
Dunno if it is Magic-proof, but it's on most of the Shareware CDROM's, so you should have it somewhere....

5068. Dpathconf() and a CDROM

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-20 00:00:00 UTC
From: msbaines@cix.compulink.co.uk
Message-ID: <E8y30w.Ctn@cix.compulink.co.uk>
Source record: 7119

For the next version of PROFILE 2, I'm scanning the U: 'drive' and reporting
on the Dpathconf() values returned for each drive and filesystem.

However, it gets to a CDROM and it doesn't like it, sometimes crashing under
MagiC 5. This drive isn't listed under pun_info and it also fails a
_mediach() check which I perform before getting BPB details which is what I'd
expect and normal.

What I need is a way to skip such drives. I thought of Dopendir on U:\M\.
Would that fail on a CDROM? Ideas welcome.

The main problem I have is that the problem lies on a beta tester's system
that I don't have direct access to.

From: donnelaith@geocities.com
Message-ID: <335AEFFF.763@geocities.com>
Source record: 7120

Hello everyone,

It's me again! Please download my new benchtest program from alt.binaries.atari and I will be completely grateful for any test results that are sent to me. I am going to post a chart that will compare the speed of all Atari computers, and all Atari emulators like MagiC. I want to get as many different computers as possible and as many different options as possible...

I have written a second version for those of you working in the original Atari resolutions (ST LOW) or early TOS (back to TOS 1.0)

So far, I have the following results:

(1) 1040ST TOS 1.0 no accessories ST LOW
(2) MegaSTe TOS 2.05 8MHz NoCache ST HIGH
(3) MegaSTe TOS 2.05 NVDI4 8MHz NoCache ST HIGH
(4) MegaSTe TOS 2.05 16MHz Cache ST HIGH
(5) MegaSTe TOS 2.05 NVDI4 16MHz Cache ST HIGH
(6) TT030 TOS 3.05 TT MED
(7) TT030 TOS 3.05 TT HIGH
(8) TT030 TOS 3.05 NVDI3 TT MED
(9) TT030 TOS 3.05 NVDI3 TT HIGH
(10) TT030 TOS 3.06 TT MED
(11) TT030 TOS 3.06 TT HIGH
(12) TT030 TOS 3.06 NVDI3 TT MED
(13) TT030 TOS 3.06 NVDI3 TT HIGH
(14) Mac Performa 638CD, MagiC, NVDI4 832x624x256 colors
(15) Mac Performa 6230CD, MagiC, NVDI4 640x480x256 colors
(16) Mac Powerbook 145B, MagiC ST HIGH
(17) Mac Powerbook 190cs, MagiC, NVDI4 640x480x256 colors
(18) Power Mac 9500, MagiC, NVDI4, 21"mon. 1152x870x256 colors
(19) IBM 350/P100, TOS2WIN 95 SVGA

BENCHTEST FAQ:

(1) Why is your program better than GEMBENCH?

Well, its not necessarily better, but it is different. I wanted to make a program that simulates actual programs that people use from day to day. I'm not concerned with the time it takes to call a vdi function 10000 times in a row. I'm concerned with stuff like, "Well, how much faster will my word processor be on my Performa running MagiC? How about running in 256 colors on my 19" monitor in 1280x960 resolution?" I have desinged "real-world" tests into this program so I could make some "real-world" comparisons.

(2) Your program won't run on my 1040ST/MEGA4 because I get a dialog that says, "Current screen resolution is unacceptable..."

I have based all of my tests on a stock TT030 with stock hard drive. I have written another version of the program called "E_BENCH2.PRG" for those Atari users with older versions of TOS (back to TOS 1.0) and color monitors. This second version runs in ST LOW. One drawback is that due to the changes I had to make in the tests so they would work in ST LOW/TOS 1.0, the results may be up to 10% different from those produced by the original program. For this reason, please use E_BENCH2 for older Atari computers only.

(3) The program crashes when it gets to "Hard disk write".

It seems that I did not anticipate all possible combinations. (or that many at all really) Please try the following: Run the program from Drive C:, and make sure there is at least 10 megs free on Drive C:. I will try to improve the routine in the future but I have tested it on two different TT030s, 3 different Performas, booting from a syquest EZ135 on a Performa, 2 different Powerbooks, a 9500 Mac, booting off the internal drive, and off a Syquest EZ135, and had no trouble. Someone even emailed me test results from their IBM, running TOS2WIN and it worked fine. If you try the above 2 steps and still crash PLEASE email me so I can fix it!

Finally, I would like to make a German version. It seems everyone always writes stuff in German and it has to be translated to English. Well, I want to do the reverse. Anyone want to help me? If you could send me a translation of the text in my program, I will give you credit in the German version...

Good luck to all in the Atari world,

Rob Meyers

Throw WERCS in the trash. :-)

Seriously WERCS is crap. I have heard that there is a new free(?)
RSC editor which handles everything including colour icons. If
it's not usable there is Interface which is the best I have ever
seen. Not perfect but defenitly the best you can get.

If you must use WERCS I guess you have to design your resource
files using TOS. :-\

5074. MagiC 5 and menu_popup()

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-21 00:00:00 UTC
From: rojewski@primenet.com
Message-ID: <5jggbdkg1@nnrp01.primenet.com>
Source record: 7125

Magic 5 doesn't seem to be providing the AES >=3.3 functionality for
menu_popup(). The AES verison = 3.99, and the call to menu_popup()
returns a zero (0).

I have heard from NEWSie users that the popups did appear under
Magic, but I cannot see them.

Is there a Magic configuration variable I can set to support AES >=3.3
features like menu_popup()?

>Hmm, I had problems with the first method as well but the second one
>works (unless nobody has bothered to tell me).
I got the second idea from you - you sent me the SCANFONT file and code
before.
It works OK except not so well under plain GDOS at times, say with a
Timeworks setup. The screen fonts are OK but the TW fonts aren't listed on
some systems (or some TW version fonts?). It's weird.

I've since tried using work_out[10] which gives the number of screen fonts
to start with, which works a *little* better under more circumstances:

```
screenfonts = work_out[10];
loadedfonts = vst_load_fonts(handle, 0);
totalfonts = loadedfonts + screenfonts;

printf("Screen fonts available: %u\n", screenfonts);
printf("Loaded fonts available: %u\n", loadedfonts);
printf("Total fonts available: %u\n", totalfonts);

for (i = 1; i <= totalfonts; i ++)
{
font_id = vqt_f_name(handle, i, fontname, &type);
fontname[31] = '\0'; fontname[strlen(fontname)] = '\0';
printf("%-3u %-5u %d %s %s\n", i, font_id, type,
(type == 1) ? "Outline" : "Bitmap ", fontname);
}
```

Hmm... maybe it does, but I don't think it does. I don't like it
anyway. Interface is better.

> Anyway the program is called "RCS30"- try to do a filesearch for it

I havn't tried this one. Hss anyone used it? Is it good?

Ever had a message so important you just had to tell the world?
Well, this is one of those messages. It's about "SUBMITKING", one of the best resources I've found for promoting a website. The URL is http://www.submitking.com and they'll submit your URL to 100 marketing resources (like Yahoo, Altavista,Lycos, Excite, etc.) for just $10US and you just fill out one form and press one button!

Tell them SusieQ sent you!

5079. ST+ Want Writers?

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-22 00:00:00 UTC
From: "ST+ Diskmagazine"
Message-ID: <335eabdb.13649856@news.airtime.co.uk>
Source record: 7130
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

ST+ Diskmagazine, The only Monthly ATARI publication, and currently
enjoying its second successful year :)

Ever felt the urge to write an Article? or maybe you have some
software that you think is brilliant and want to tell everyone about
it? well here is your chance,
Maybe you want to FREEly advertise or promote something ATARI
related that you are involved with,
ST+ Is mostly an "off line" production with a targeted audience
of people who do not have access to the Internet, so maybe you want to
send them a message, tell them something or make them aware of
something?

ST+ is always pleased to receive anything that anyone writes!, so
long as it is in good taste, not offensive or illegal, then it will
get used,

ST+ is more than likely about to go to TWO disks per month, this
is to accommodate 256 colour graphics and other essential diskzine
files, NOT for PD or useless programs you already have :) but for
extra articles and graphics,

So there will be room for just about anything you want to submit,

ST+ are especially on the look out for anyone who wants to take
on a regular, more permanent role, the diskzine is cut into sections,
with each section having there own editor, so maybe you know enough on
a subject to write every month and have your own little corner,

Whatever you want to write, then simply send it in and it will be
used, this is your chance to get your views/ideas and thoughts across
to not only the on line community, but also the majority of ATARI
users who do not have the Internet,

ST+ is distributed world wide, check out the ST+ web pages for
more information,

Don't forget! you do not need to contribute, you can still enjoy
ST+ by just reading it..we don't mind :)

All Feedback, Submissions to : diskzine@earthling.net
Visit ST+ st: http://www.geocities.com/TimesSquare/Alley/7454/

5082. ANNOUNCEMENT - DESIGN yourWARE

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-23 00:00:00 UTC
From: Patrick Miller <support@registerline.com>
Message-ID: <335DAF6A.3422@registerline.com>
Source record: 7133

Regi$ter Online! has implemented a terrific new type of "software"
concept called, "Design-YOURware."

"Design-YOURware" is a unique programming proposal and creativity tool
for software users and software developers alike.

Using "Design-YOURware," a software user may design his or her software
anyway desired while submitting several personal choices to a
programmer, who will in turn consider developing the user's "creation"
upon a private Work-For-Hire Contract between user and developer.

Software developers may use "Design-YOURware" as a creativity tool,
reviewing all options for creating unique programs. In particular,
software developers may especially enjoy using what we have named, "What
the @#$!?"

This tool (What the @%$!?) is a random idea developer, spitting out
random concepts unique to the developing environment geared to jar new
ideas. All credit for this random idea developer goes to Javascript
editor Don.

You may experience this new concept, "Design-YOURware," at
www.registerline.com

All comments, criticisms, and questions are welcome.

Thank you
Patrick Miller

SORRY !

Wrong newsgroup ! I thought I was in a german newsgroup ! Sorry guys ...
English version follows ...

Hi,

we recently released the RUNNING Shareware. You can find the official
mail of the Running mailinlist below. As I am not familar with the topic
newsgroups
I would be happy if someone would distribute this message to other Atari
newsgroups.

Thanks in advance

Mike of STAX.
michael.opel@sap-ag.de

********** RUNNING NEWS **********
* A Doom style game for ATARI Falcon computers *

Sorry for the delay, but we had big trouble with
our mailinglist account.

****

On 14th of April RDT released the

RUNNING SHAREWARE EDITION.

You can download the files (Runshar1.zip, Runshar2.zip)
from our homepage at:

http://stio1.fh-wuerzburg.de/student/i381

Size at all: 1700kb.

Other sites: * ftp.uni-kl.de
* ftp.uni-regensburg.de
* ...

****

This version contains the first episode. It's full playable !
So there are different enemies, weapons, secret rooms and
some other specials. Of course we don't show everything -
You will get the other stuff in the following epsiodes.
Please read the README and HOWTO included in the zip files for
detailed information. Check it out !

Feedback:

Send us your opinion, critics and maybe problem reports, please !

Development information:

We are finishing the next two episodes at the moment. Expect five episodes in the final version. We hope to get the final version shipping soon (yes, I tell you this again and again ...).

Ordering:

Please DON'T order the game now ! Please wait for the FINAL RELEASE ! Everyone in the mailinglist will get the release acknowledgement right after the release - additionally one week before it a advance release note (for ordering ...) ! SO DON'T PANIC !

Your RDT team.

Source record: 7135

Hi!

In article <E8y30w.Ctn@cix.compulink.co.uk>,
msbaines@cix.compulink.co.uk ("Mark Baines") writes:
> For the next version of PROFILE 2, I'm scanning the U: 'drive' and reporting
> on the Dpathconf() values returned for each drive and filesystem.
Well, I don't know PROFILE 2, but wouldn't it be better to check the
Dpathconf()-values for the affected directories? Remember that symbolic
links within a drive may point to a completely different filesystem. For
the same reason, use Dpathconf() with "\." at the end of the requested
path, as otherwise you'll only get information about the filesystem the
requested symbolic link to a directory lies in. I.e. in MagiC, using
Dpathconf("U:\a", mode) will supply information on path U:\, whereas
Dpathconf("U:\a\.", mode) will follow the symbolic link and report on U:\a\.

> However, it gets to a CDROM and it doesn't like it, sometimes crashing under
> MagiC 5.
Which CD-ROM driver is used? The XFS from Steffen Engel together with his
SCSI driver? Actually, there shouldn't be any problems in calling
Dpathconf() on CD-ROMs, but I was told that Thing sometimes crashes when
reading directories with Steffen's XFS. So far, I don't know why this
happens, but as Thing has never had such problems with other drives and
drivers, I suspect the problem is located in the XFS or the kernel.

> This drive isn't listed under pun_info and it also fails a
> _mediach() check which I perform before getting BPB details which is what I'd
> expect and normal.
Sure.

> What I need is a way to skip such drives. I thought of Dopendir on U:\M\.
> Would that fail on a CDROM? Ideas welcome.
Dopendir() may or may not work on CD-ROMs. Some MetaDOS-drivers even
offer for these calls for the CD-ROMs under SingleTOS. That means,
Dopendir() may return -32L for CD-ROMs, a valid handle or an error code
(if no CD-ROM is inserted). There's no way to use Dopendir() to
distinguish between different media types.

Ciao

Thomas

Source record: 7137

Hi!

In article <5jggbdkg1@nnrp01.primenet.com>,
rojewski@primenet.com (John M Rojewski) writes:
> Is there a Magic configuration variable I can set to support AES >=3.3
> features like menu_popup()?
No. If you want to use the extend menu features with MagiC, you have to
run the little TSR xmen_mgr.prg first (it's installed as one of the
utilites in the \gemsys\-directory). Andreas Kromke decided to leave
these functions out of the main kernel, because he thinks too little
programs actually use them ...

And btw., if possible, always use appl_getinfo() to check whether certain
features are supported by the current AES, and not only the version number.

Ciao

Why on earth did he think that? It's almost harder to find a program
that doesn't use them these days then find one that does. :-)

5090. looking for atari os's documentation

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-23 00:00:00 UTC
From: eglis@ubaclu.unibas.ch
Message-ID: <1997Apr23.143142.47481@yogi.urz.unibas.ch>
Source record: 7141

hi,

sorry if this question has come up before, but i don't read comp.sys.atari
very frequently.

i'm in the need of a complete documentation (preferably online) for
the atari os. i have an old book "atari-st profibuch" that covers everything
up to tos 1.4. now i'm writing an alternative operating system (oberon) that i
want to be able to run on any atari i can think of. unfortunately, the
system relies on some tos system-variables and changes some system vectors.
because of this i'd be glad to have documentation on "newer" tos developments,
to ensure compatibility.

thanx for any hints,

simi

> in order to do other thing, one could have instant access to the current
> co-ordinates, and thus, be able to update w,h in real time?

Perhaps you can try something like (not real C code :-)):

```
draw_frame( starting_pos, mouse_pos);
old_mouse_pos = mouse_pos;
while( mouse_keypressed ) {
graf_mkstate( &mouse_pos, &mouse_keypressed);
if( old_mouse_pos != new_mouse_pos ) {
vwrs_mode( vdihandle, MD_TRANS);
draw_frame( starting_pos, old_mouse_pos); /* clear old frame */
vwrs_mode( vdihandle, MD_REPLACE);
draw_frame( starting_pos, new_mouse_pos); /* draw new frame */
old_mouse_pos = new_mouse_pos;
}
/*
other real-time treatment ...
*/
}
```

draw_frame should draw a frame using standart VDI call

RTFM ! Popup functionality is put into external modules, since few
programs use it. The MagiC distribution has an executable that must go
into the auto-start folder, only then MagiC does popups.

Cheers Peter

5096. ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-23 00:00:00 UTC
From: nejeh@gdi.net
Message-ID: <5jm9t2$65g@news.gdi.net>
Source record: 7147

Please take the time out to read this email. it is worth your time.

ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!
Or send a message to millions of people...

NOW YOU CAN ADVERTISE FREE AND GET DRAMATICALLY
MORE RESPONSES THAN ADVERTISING ON NATIONAL TELEVISION

With E-mail your potential customer is forced to read at least the
headline of your letter. Unlike TV, magazines, newspaper ads, and
direct mail where more than 99.99% of the recipients will skip right
over your advertisement.

TURNS YOUR COMPUTER INTO A CASH REGISTER: Conservative estimates indicate
well over 100 MILLION people will have E-mail accounts in the next year!
E-Mail Blaster turns your computer into a cash register by giving you FREE,
immediate access to all of them. Do you think some of the more than 100
million people with E-mail addresses would be interested in your products or
services? Even if you don't have your own products or services you can
still make money buy promoting our computer software!!!
You can make money with our new software called E-MAIL BLASTER

Here's how:
* By Using E-Mail To Sell Your Products & Services
* By Using E-Mail To Sell our Computer Software such as: Email Blaster, Web Walker,
Email Lock Box etc.
* By Renting or Selling Your E-mail Addresses
* By Becoming A Distributor for e-mail BLASTER

MUCH FASTER: With bulk E-mail you get responses back in 1 to 4
days instead of waiting weeks or months like with television or print
advertising. You can begin filling orders the same day you send E-mail.

FREE ADVERTISING WORTH MILLIONS: It costs millions of dollars to mail out
millions of letters using the United States Postal Service! Now you can
send your ad to MILLIONS of people for FREE using E-Mail BLASTER

E-MAIL BLASTER IS ACTUALLY 3 PROGRAMS IN 1: E-Mail Blaster is amazing new
technology and the most advanced bulk E-mail software on the market today.
(1) E-Mail BLASTER automatically extracts E-mail addresses from America
Online, CompuServe, Prodigy, and the other online services, the Internet,
web pages, news groups, and hundreds of other sources. (2) E-Mail BLASTER
automatically stores the E-mail addresses in your computer along with
keywords that describe hobbies and interests to created highly targeted
E-mail addresses. (3) E-Mail BLASTER sends your marketing letter or ad to
MILLIONS of targeted E-mail addresses at the push of a single button!

HOW DOES E-MAIL BLASTER WORK? E-Mail Blaster has dozens of special filters to automatically harvest E-mail addresses from major online services such as: America OnLine, Compuserve, Delphi, Genie, and of course the internet.

AOL AUTO EXTRACTOR: E-Mail Blaster has many special features like the AOL Auto Extractor that let's you use a regular dial-up Internet connection to collect names and addresses from America Online. Collect America Online addresses without being a member. Allows you to download names and addresses from America Online without paying membership fees or online charges. Auto Extractor for all of the online services and Special E-mail database search engines will also be available at no additional charge.

SIMPLE TO USE: E-Mail Blaster does all the work for you. Unlike other programs where you must cut & paste addresses, E-Mail Blaster does it for you automatically. And, unlike other E-mail programs, with E-Mail Blaster there is no need to purchase any additional software

SPEED: Your time is important. E-MAIL Blaster is DRAMATICALLY FASTER at extracting and sending E-mails than all the other programs on the market that we tested it against.

NO SPECIAL EQUIPMENT NEEDED: E-Mail Blaster runs on a PC with Windows 3.xx Windows 95, Windows NT, a 386 or faster processor, 4 MB RAM, and a hard drive with at least 10 MB free and your own SLIP or PPP connection. No other software needed. Also runs on a Macintosh with Soft Windows installed.

****
This message was sent using E-Mail Blaster.

E-Mail Blaster is The World's Leading Bulk E-mail software.
With E-Mail Blaster you can advertise to over 100 million people for FREE!

Cost: We are giving away Email Blaster your only cost is $165.00 License fee.

THAT'S IT!!!

Our company is in the software business of developing cutting edge products, so we know if you have the opportunity to use our software FREE you will be our future customers. We know we need you to make our software business a true success!

RTFM! A few? :-))) Pick 10 apps made in the last two years, how many
of them use popups? 9? :-)

It's not a big deal now when we can use them under MagiC anyway, but I
wouldn't say that "few" program uses them. Most does.

^^^^^^^^^ ????????

Well I am a little fed up of reading so often definitive opinions about products.
Reasonably, there are in most cases pros and cons in this matter.

I have been using WERCS for years, and I have developed dozens of resources with
it, with no problem. Is that such a crap?
OK, I run a MegaSTE, so I don't know about color icons.
For WERCS vs MAGIC, whose fault is it? HiSoft used to have excellent developpers
and to produce cleanly programmed utilities.

I am not setting up a debate. I just wanted to say: "Please don't fire so easily
on commercial products that are respectable in many aspects, because they are not
so many".

Cheers.

Sorry, but I can't say that I like Wercs. Okey it was good when it was
released in 98 or something but if you want ot do some fun stuff you
realy need a better resource editor. For regular resource files using
mono it's okey but not if you have got colour and wants to do some
more advanced stuff.

> I have been using WERCS for years, and I have developed dozens of resources with
> it, with no problem. Is that such a crap?

Maybe it's wrong of me to say that it's crap, but it's very outdated
and can't do what the "new" can do. It doesn't realy support AES above
3.3 with 3D objects, colour and colour icons.

> OK, I run a MegaSTE, so I don't know about color icons.

Yup and if you use it for pre Falcon programs it's fine.

> For WERCS vs MAGIC, whose fault is it? HiSoft used to have excellent developpers
> and to produce cleanly programmed utilities.

They do? The compilers are fine but the tools to use them with isn't
exactly that cool. I realy can't stand the editor supplied with
Lattice, but I wouldn't either want to live without the integrated
developing enviorment which it supplies. :-\

> I am not setting up a debate. I just wanted to say: "Please don't fire so easily
> on commercial products that are respectable in many aspects, because they are not

I see what I you mean but I agree with you 100%, but Wercs is old and
ther are much better programs to do the job for you.

5102. SOFTWARE RELEASE: KP SACK 1.0 and SAM 1.3

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-25 00:00:00 UTC
From: jacquesa@cs.man.ac.uk
Message-ID: <5jq9oa$6rg@m1.cs.man.ac.uk>
Source record: 7153
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer,comp.sys.atari.st

I would like to inform you that KP SACK 1.0 - SAA Construction Kit - is now available for download either from various FTP sites, or from the Kosmik Phish homepage at:
http://www.cs.man.ac.uk/~jacquesa/kpp/

For those who are not aware of what an SAA file is, it is a way of creating new events which sounds can be assigned to via SAM. KP SACK provides a simple interface for creating SAA files and makes it as easy as possible to make use of them within your own software. To make full use of SAA files, you will need SAM 1.3...

SAM 1.3 is an (officially sanctioned) bugfixed version of Atari's System Audio Manager, which allows the user of an Atari system with DMA sound and TOS 2.xx or greater to assign sample sounds to system events such as window manipulation.

For more information on either of these programs, either visit our WWW pages at the above address, or read Atari Computing.

```
Dominique Bereziat (bereziat@ozone.inria.fr) wrote:

: draw_frame( starting_pos, mouse_pos);

Yep. (Use v_pline) But draw in XOR.

: old_mouse_pos = mouse_pos;
: while( mouse_keypressed ) {
: graf_mkstate( &mouse_pos, &mouse_keypressed);
: if( old_mouse_pos != new_mouse_pos ) {

: vwrs_mode( vdihandle, MD_TRANS);
: draw_frame( starting_pos, old_mouse_pos); /* clear old frame */
: vwrs_mode( vdihandle, MD_REPLACE);
: draw_frame( starting_pos, new_mouse_pos); /* draw new frame */

Again, you'd better use XOR mode to draw. This way you can easily remove the
old rectangle (2 times inverted -> original background) and draw a new one
which shows what's beneath it...

Hi, its me again.

trying shel_write(1, 1, 1, prog, tail) in Magic 5, but the prog will not start until AFTER the calling program has ended! I tried (1,1,0, etc, but no luck.

Then I tried pid=Pexec(100, prog, tail, NULL); It works ok, but the call to Pwaitpid(pid, 3, NULL) returns -32 as the return code, which I think is 'Invalid Function'. pid seems to be positive integer as stated in docs.

Help,
John

Shelwrite work well under Magic 5, without my documentation I don't know
how it work it something like shel_write(100,....), I 'll look for it.

Pexec(100,...) don't work under Magic 5 you should use shel_write()

bye

The best of the lot is Ruftrade2. Pay the $10.00 shareware fee. That version works even better than the demo. The author is in UK.

There are a number of other programs available. Look in the misc. or text (doc, info, etc.) directories. There is one that allows you to edit the dictionary yourself. Some have source.

I have most of them. Contact me via email for more info.

Later,

George

Hi John

MagiC5 shel_write values are different from AES4 etc. Typical isn't it!
In my programs I cater for singletos (and use Pexec), MultiTos (shelwrite)
and MagiC (shel_write). It's a pain but there's no other way AFAIK.

Here's an example of code that does launch programs concurrently with the
calling app (without the calling program having to end).

*maxapps retrieved from appl_init etc.
cmp.w #1,max_apps
bgt.s .multi

*singletos, won't run until calling app ends
Pexec .singletos
Pexec #0,env_ptr,#com,#env
Pterm0

*magic_version, is retrieved from the MagiC cookie etc.
*Basically execute this version of shel_write if MagX found.
.multi
cmp.b #$01,magic_version
blo.s .multitos
Shel_write #1,#1,#100,env_ptr,#com
bra.s .donerun

*otherwise assume it's MultiTOS
.multitos
Shel_write #0,#1,#0,env_ptr,#com

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-26 00:00:00 UTC
From: Olivier Landemarre <Olivier.landemarre@utbm.fr>
Message-ID: <3361ee79.0@news.utbm.fr>
Source record: 7163

Explanation of Shel_write()

shel_write(mode,flag_gem,thread,exec,tail)

under multitasking system:

mode = 1 -> Launchnow (theres some bits for environment, memory allocate
for prg but they are optionals, tail depends of them but without it's
normal a tail)

flag_gem = 1 for GEM program or 0 for TOS program (under Magic it launch
VT52.PRG witch start your program)

thread = 100 : start in parallel mode
101 : start in single mode
..

I prefer alway's start a program in parallel mode and if I want a single
mode I wait for the end of the program by evnt_messag()
If I'm under monotasking system I prefer use Pexec().

I think it's enought to answer to your question.

>Well, I don't know PROFILE 2
THE system analyser for all Ataris and OSes. Current version 2.14 but 2.20
is out RSN and incorporates more reporting and better compatibility.

Try HENSA via ftp, telnet, gopher at micros.hensa.ac.uk
/micros/atari/tos/p/p143 directory

There might be older versions at because they are such a problem logging into!

Paderborn in Germany via ftp.uni-paderborn.de
/atari/tools/util directory.

University of Michigan in the US via ftp atari.archive.umich.edu
/Utilities/Benchmark directory.

Imperial College mirror sites via ftp src.doc.ic.ac.uk
/packages/atari/umich/
/packages/atari/uni-paderborn directories.

File is called PROF2_14.ZIP.

>For the same reason, use Dpathconf() with "\." at the end
Yep, I do.

>Which CD-ROM driver is used?
ExtendOS I think, It's not my system but a beta tester's.

>Dopendir() may or may not work on CD-ROMs.
Having subsequently done a test I know do a Dopendir() for each path before
requesting each of the Dpathconf() values and it does indeed fail on the
CD-ROM as I'd hoped.
Another problem bites the dust!

Thanks Thomas.

Is there a rule as to how many scratch registers are available, or are used by TOS?

In general, I know I can count on D0-D1 and A0-A1 being corrupted by an OS call, but how about D2+ and A2+, or, for that matter, FPU registers?

The reason I ask is that I have patched into the XBIOS vector to provide an XBIOS interface to my Toolbox DLL engine, and having used the first two data and address registers as scratch registers, I need to know if more registers are deemed scratch and therefore need to be saved by my code.

What is the buggiest TOS version? ie most prone to crashing or corruption of user/system data?

(I would assume disc based TOS 1.0. But I may be wrong)

I need to know this so I can find it and test my code against it before release. Read: "if it survives that, then it will survive anything" {[:-)]

Hi,

: Is there a rule as to how many scratch registers are available, or are
: used by TOS?
:
: In general, I know I can count on D0-D1 and A0-A1 being corrupted by an
: OS call, but how about D2+ and A2+, or, for that matter, FPU registers?
:
: The reason I ask is that I have patched into the XBIOS vector to provide
: an XBIOS interface to my Toolbox DLL engine, and having used the first two
: data and address registers as scratch registers, I need to know if more
: registers are deemed scratch and therefore need to be saved by my code.

On a XBIOS call you should be free to use D2 and A2 too without saving
them.

I think you have to separate the test, one for Atari ST tos and
one for Atari STE tos. What worked good with tos 1.0 and 1.02 (ST)
did not work good with tos 1.4 and 1.6 (STE) and opposite.

5121. Toolbox API: A sample extension in C

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-27 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <41c7cd$b2729.b0@HERMES>
Source record: 7172

As you may be aware, I have been readying my Toolbox DLL engine for later public release.

(I still haven't finalised the nomenclature for the "DLLs". What would you prefer to call them? ie Plug-ins? [Toolbox] Extensions? Libraries?)

In the past, all extensions have been written in assembly language. However, as coding in 68000 assembly language appears (unfortunately) to be a dying art, I have modified things slightly and extensions may now be written in C.

The following example extension (written in Lattice C) should shed some light upon writing an extension. For those of you who have followed a thread similar to this a month or so ago, this is a C version of the assembly language example posted with that thread. Compiled under Lattice 5.60, it comes out to 40+ bytes larger in memory usage, for no real increase in functionality.

All externally callable functions are __stdargs (Stack passing).

__saveds may be applied to some funcs if you use base relative data.

I will post the "te.h" header that this sample code needs shortly.

This extension was compiled under Lattice C 5.60, with 32 bit ints, for a 68000 with no floating point and no debug info, generating near code and near data, and passed without errors or warnings. (I'd set the "ignore C++ comments" flag/option, however)

(BTW: I assume you are all prescient enough to understand what the type "uint32" refers to)

-- Begin sample code

```
// TE.C
// Sample Toolbox extension in C
//
// 27-Apr-1997
//
// (C) Copyright 1997
// G. Miller
// Auckland
// New Zealand

#include "0/te.h" // contains prototypes used in this extension
#include "0/types.h" // contains definitions of "uint32" and so forth
```

```
// this is version 0.01.00 of the extension
#define VERSION 0x00100

// this is correct as of 27 April 1997
#define DATE 0x19970427

// CURRENT_TOOLBOX_VER is defined in te.h and is 0x012065 (v1.20.65) at
// this point in time. This value will change over time, however, so you
// are advised to use the define from the include file rather than hard
// coding this value in your source
#define MIN_TLBX CURRENT_TOOLBOX_VER

// forward declaration required in ExtensionInfoBlock
extern FunctionTable ft[];

// prototypes for sample API calls within extension
__stdargs uint32 _teOne( void );
__stdargs uint32 _tePassed( uint32 );
__stdargs __saveds void _teStore( uint32 );
__stdargs __saveds uint32 _teRetrieve( void );

// this structure _must_ be first (offset zero) in the initialised data
// segment
// It will be examined by the Toolbox prior to loading it, so all
// elements within this structure _must_ be initialised at compile time.
// __far places it in "Far data" at beginning of data seg, as opposed to
// "near" data which is at the end of the initialised data segment
ExtensionInfoBlock __far eib = {
// the first 64 bytes identify this as an extension
// and give some info about itself
'tb16', // magic number. REQUIRED
'_TE_', // library identifier "cookie". REQUIRED
0x00FFFF, // library number. MUST = 0x00FFFF. REQUIRED
VERSION, // version number
DATE, // date
sizeof( ExtensionInfoBlock ), // size of this info block. REQ
"TE_example", // Textual label. 10 chars + NULL. Required
0, // alignment byte. Must be zero
0, // Reserved. Must be zero
"", // Padding to 64 byte boundary

// the next 64 bytes declare what this extension requires
MIN_TLBX, // minimum toolbox version needed
0, // reserved. Must be zero
68000, // CPU required
0, // FPU required (if any)
0, // reserved (must be zero)
0, // reserved (must be zero)
0, // extension flags (should move to prev block)
0x0100, // TOS version needed
0x01, // TOS Flags : 01 = EQ, 02 = GT
"", // padding to 64 byte boundary
```

```
// the next 64 bytes have pointers to needed data
ft, // function table REQUIRED
teExit, // called when extension is being unloaded
"", // padding to 64 byte boundary

// the fourth 64 bytes have no higher purpose at the moment
// but the first two entries are REQUIRED
'tb16', // magic number REQUIRED
'_TE_', // library identifier "cookie". REQUIRED
"" // padding to 64 byte boundary
};

// ftr _must_ be IMMEDIATELY before ft in memory. The members of this
// three element array are :
// 1) Number of functions in ft table
// 2) Lowest function number in table
// 3) Highest function in table
// this can (and probably will) be overwritten with the correct values
// when the extension is loaded
uint32 ftr[] = { 4, 0x0100, 0x0103 };

// The function numbers in the ft array _must_ be in ascending order
// The very last entry is "0x10000" to signify "end of table", and should
// point to a dummy "do nothing" function, or NULL
// The high word of the function numbers will be modified on loading
// to reflect the library number assigned to this extension
// Function numbers should begin with number 0x100, as function numbers
// below this are "about this lib", which have been obsoleted by the
// tlbxLibInfo call introduced about a year ago
FunctionTable ft[] = {
{ 0x000100, _teOne },
{ 0x000101, _tePassed },
{ 0x000102, _teStore },
{ 0x000103, _teRetrieve },
{ 0x010000, 0L }
};

// used by dummy API calls
uint32 saved;

// teInit is called when extension is loaded for the first time.
// Any initialisation the extension must do should be done here.
// It should return either a pointer to the info block or NULL.
// It _must_ be located at the start (offset zero) of the code segment
__stdargs ExtensionInfoBlock *teInit( ExtensionParameter *ep )
{
return &eib;
}

// teExit is called when extension is being unloaded
// This is a good place to put any clean-up code (freeing up any RAM
// the extension may have Malloc'd, for example)
// It will only be called if the ll_unload pointer in the info block
```

```
// is non-zero.
// This function is optional, and may be omitted if it isn't needed
__stdargs void teExit( void )
{

}

// some sample API calls
// return 1
__stdargs uint32 _teOne( void )
{
return 1;
}

// return the passed parameter
__stdargs uint32 _tePassed( uint32 val )
{
return val;
}

// store the passed parameter
__stdargs __saveds void _teStore( uint32 val )
{
saved = val;
}

// return the stored value
__stdargs __saveds uint32 _teRetrieve( void )
{
return saved;
}

-- End sample code, begin signature block

Unfortunately, that approach won't work. Ultimately, you will need
lots of Beta testers with different platforms (or pick up a lot of
different STs sans monitors cheap).

```
g > Is there a rule as to how many scratch registers are
g > available, or are used by TOS?

According to the Atari Gemdos reference manual, D0-D2 and A0-A2 may
be modified by Gemdos calls, while D3-D7 and A3-A7 will always be
preserved. AFAIK, no Gemdos function uses the FP registers at all.

Use 100 (MagiC parallel) or (101 MagiC single) for the third parameter.
It's all in the MagiC development documentation.

> Then I tried pid=Pexec(100, prog, tail, NULL); It works ok, but the

It obviously means the function doesn't exist yet in MagiC ! Haven't you
read the MagiC developers docs ? But the shel_write way is the better way
to parallel start GEM programs.

Cheers Peter

The buggiest TOS is normally considered TOS 1.0, with little distance
ahead of TOS 1.2. But note your approach doesn't replace real testing on
other OS versions, as those do not simply have less bugs, but also
different bugs, which might break your code after it survived everything
in TOS 1.0.

Cheers Peter

5130. ST kit for sale (UK)

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-29 00:00:00 UTC
From: Drew Gibson <drew@thegibsons.demon.co.uk>
Message-ID: <ctbDmCAk7YZzEwdX@thegibsons.demon.co.uk>
Source record: 7181

```
Atari stuff for sale as follows :-

If the prices appear with a funny character in front of them, they
should be UK pounds :)

HARDWARE
========
```

Atari 1040 STe (upgraded to 4MB) £75 - see @@@ below
(includes Quickshot joystick,
Atari mouse, cables - TV and power)

Atari 520 STfm (upgraded to 2.5MB) £15
(BROKEN - wont boot correctly,
but may be suitable for repair or
for breaking for spares)

Gasteiner 42MB hard drive (DMA) £45 - see *** below
(includes leads + utility software)

Philips CM8833 MkII colour monitor £60
(suitable for ST low and medium
includes ST <-> monitor lead)

```
All of the above come with manuals, except broken STfm.
All in mint condition.

For the above kit, email me (bottom of list) to discuss P&P / delivery.

For the stuff below, P&P (1st class recorded delivery) included, where
possible. If you want registered, we can discuss that.

SOFTWARE / BOOKS
================

Games
=====
```

F-19 Stealth Fighter £8

Midwinter (strategic 3D game) £7

Maniac Mansion (funny / scary £7
graphical adventure)

Future Wars (graphical adventure) £7

Interphase (excellent 3D graphics) £5

Germ Crazy (halt the invading bugs!) £7

Time (graphical adventure) £7

F-16 Combat Pilot £5

Starglider 2 £5

Substation (Doom-like game) £10
STe only (maybe Falcon too ?)

Obsession (v. good pinball game - best £10
graphics I've ever seen on my STe)
STe only (maybe Falcon too?)

Programming
===========

Personal Pascal v2.05 £12
Actually an STF cover disk, but
I ordered the manual from HiSoft
for £20 and that's what's for sale
Cover disk included

Lattice C v5.52 £30
Excellent for learning / using C
Full development environment (incs
WERCS and many other tools)
More manuals than you can carry (almost) :)

HiSoft 'Your FirST Basic' Manual/disk £3
Well worn but useful :)

The Atari Compendium book £20
Errata included in the book in my
own fair hand. Everything you
wanted to know about Atari 'C'
/ programming

Misc
====

Timeworks V2 - ST DTP £15
boxed with manuals

Chemkit (chemical structures drawing £10
package - hi res or hi res
emulator required - I'll include a
PD one that I used. Manual included)

PFM Plus - personal finance manager £7
excellent software - incs manual

1st Word Plus (word processing package)£10
good / basic WP with manual

3D-Calc (3 dimensional spreadsheet) £7
boxed with manual

*** Magic v2 £15
Fully pre-emptive multitasking OS
manual included

*** Ease v3.01 £15
Excellent new desktop for your ST -
works a TREAT with Magic :)
manual included

*** I'll bundle these with the hard drive for £20

@@@ I'll include my entire collection of old magazine cover disks
with the STe - I'm not going to count them but there are a LOT.
Covers STF (lots), ST Review (dozen or so), a couple from a
couple of other mags. Also the first 3 Atari Computing mags
with cover disks. You can continue this one yourself :)

The entire set of Atari World (issues 1 -> 11) inc cover disks. £25
I won't split these.

It is obvious. My brother(Australia) has Netscape and freeware programm
"Cooltalk". On Falcon hardware should be easy to make an prg to take
sound from microphone input and send it through internet.
Next decoding incoming voicedata and send to the speakers.
All must be fast enough for 28800 modem users. Using slip connection.
This make money saving in long distance calls (eg.Europe-Australia)....

with best greetings
Andy

I have a Mega STe mother-board, i have questions please
answer me, because i want take advantage of the board..

what type of HDD's for Mega STe can i use? internal,
external,removable-media..
what type.? : need special connector? (prices)
Exist IDE adapter for Mega STe?

Can I connect a ET4000 with Crazy Dot to Mega STe??
how cost Crazy Dot ?
how cost ET4000 ?

what monitor i need if i can connect Crazy Dot & ET4000 to Mega STe??
what monitor? with some special connector?
Is Nova Graphics card a good choice?

exist differents types of cases for Mega STe..??
what type desktop? tower? (prices) ..what case i need if a want connect
ET4000 & Crazy Dot to Mega STe Motherboard??

what languages & kits exists for Mega STe to programming??(prices)
(like C++,C,java,perl,databases..)

I know that megaste motherboard came with TOS 2.05..then the question
is ...which are the differences between it and TOS 2.6.???

I hear that megaste have keyboard input..... what type of keyboard
....an "atari-keyboard" or "PC-keyboard"?? (what is the cost of each)

Can I up the speed of Mste ??? (16Mhz to 32Mhz)

Thanks very much to anyone that answer my questions. Good Bye Friend./

PS: Sorry for my english./

Look at the subject: Internet telephone. The guy then asks if anybody is coding the subject for the Falcon. Seems pretty obvious to me ;-) He's clearly not one to use two words when one will suffice, a bandwidth conservationist...

Yes. AtarIRC 0.71 has provisions for plug-ins, currently a doodle
sketchpad, but a Netphone is being developped by a friend, mainly
for Falcon DSP, but also with playback capabilities on STE/TT. In
the future, sampling cards like the Replay 16 could be supported,
to allow voice input on STE/TT as well. No idea on release date.

: Sorry , no.
: It is documented that D0-D2/A0-A2 can be corrupted by a BIOS/XBIOS call.

Roland, please read through the text again. He was asking what register
he was free to use without saving them when replacing a XBIOS call, and
as some OS XBIOS calls also uses D2 and A2 besides D0-D1/A0-A1 he should
be free to use them as well. That's what I was telling him...

Take care,
Daniel

5140. Help w/.rso conversion to .hrd

Newsgroup: comp.sys.atari.programmer
Date: 1997-04-30 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5k8dsi$jqj@alexander.INS.CWRU.Edu>
Source record: 6998

Can someone help? I have found a very useful looking program/source
for a font selector that I can use to advantage in TelVT102.
The source is there as is a .rsc file. It also has a .rso file which
I presume is some sort of equivalent to .hrd, .rsd, dfn. or .def.
I have written TelVT102 with Lattice C 5.6. I need to edit the font selector
box in the .rsc file.
I have tried to do it by hand, using wconvert, rs2l, rsconv, etc. Nothing
seems to work. Does anyone have any idea what an .rso file belongs with,
and/or how to convert it to WERCS. I do have the wconvert program, but
that will only cpnvert from a .def, .rsd, or .dfn file.
I tried loading it with WERCS, and renaming everything by hand according
to the names of the items in the program, and it compiles, but bombs with
a bus error when I try to run it. Clearly something is missing.

HEEEEELP!

I agree,

However, I like to torture test my code before it goes out to my beta testers. I can often learn a lot more about when/where/why it crashes by observing it myself than relying on the beta testers I have.

Yeah that's cool. The problem with apps like this is that you want it
done you better dig out a DSP book and a programming language and
start programming! Many will love you for doing it but if you have got
an idea you better try to do it your self. Okey most ideas are not
very easy to acomplish, but most actually are.

Sorry , no.
It is documented that D0-D2/A0-A2 can be corrupted by a BIOS/XBIOS call.
Indeed, a desassembly of a TOS 2.05 BIOS/XBIOS entry points shows that:
- BIOS and XBIOS share the same code. BIOS loads the address of its own routine jump table, so does XBIOS.
- Next, in the same piece of code, registers D3-D7/A3-A7 (yes, A7!) are saved in a special area (not on the stack, but this is another story...).
- Finally, via the loaded address table, control jumps to the appropriate subroutine.
(Of course, in the above description, I have skipped some details.)

So, registers D2 and A2 must be saved by your routine before a BIOS/XBIOS call.

Regards.

Roland Prajoux, LAAS-CNRS, France, prajoux@laas.fr

Re: ATARI 1040 ST-fm First Word Plus Help Request

Dear Atari Folks,

I'm trying to help an older gentleman who invested in an
Atari machine for word processing many years ago.

I need your help to find information about how to "export"
several large, important documents from First Word Plus (the
word processor) on the

Atari 1040 ST - fm (platform)

to any DOS or Windows MS Word, Wordperfect or ASCII format.

If you cannot advise, I may have to *print* the documents
and then scan them with OCR! I'm hoping you may have a
better, more straightforward solution?? Please?

Thank you, in advance, for any advice you may supply.

I'd really like to see one of these babys too!
Perhaps there's source avilable to a unix flavored version that can
be ported to run on a Falcon? One thing that concerns me however...
I once read that 030 Macs couldn't do Internet phones cause the processor
wan't fast enough (most likely a bull excuse), which might mean a special
DSP/CPU married version must be coded from the ground up.

Personaly, it seems to me that an 8bit half duplex version should be
possible on STe machines as well...so long as you plug in a Replay, or
similar cart to the ROM port. Maybe even a 16 bit version for the Replay
16?

Real Audio would be really cool too!

Brian

The *.RSO file is a native definition file for ORCS, the shareware RSC
editor. It can also write DEF files, IIRC. ORCS should be available from
any good Atari FTP server

One problem you maight run into, is that the DEF format only allows 8
char object names, while HRD and RSO allows more...

I think your problem is another one, though. If you get a bus error
after editing the RSC file, you have changed the structure of the RSC in
such a way that the program gets an adress error while dealing with the
RSC. However you name the objects is not going to change that...

Bye,
Vegard Hofsoy

: I'd really like to see one of these babys too!
: Perhaps there's source avilable to a unix flavored version that can
: be ported to run on a Falcon?

Yep. Take a loot at sunsite.unc.edu (or one of it's mirrors) in
/pub/Linux/apps/sound/talk/
There should be a few sources in there.
Such a source would have to be rewritten to use the Falcon audio hardware,
though. (Except if it uses /dev/audio, which is also available for MiNT)
The programs probably work using MiNTNet and the portlib, but they could be
adaped for use with STiK too.

: One thing that concerns me however...
: I once read that 030 Macs couldn't do Internet phones cause the processor
: wan't fast enough (most likely a bull excuse), which might mean a special
: DSP/CPU married version must be coded from the ground up.

The compression routines usually need quite a lot of CPU power.
Some of the programs use GSM compression (sources freely available,
maybe even a DSP version somewhere?) or something of their own.
This part might have to be ported to the DSP to get enough speed...

: Personaly, it seems to me that an 8bit half duplex version should be
: possible on STe machines as well...so long as you plug in a Replay, or
: similar cart to the ROM port. Maybe even a 16 bit version for the Replay
: 16?

Even at 4 kHz 8-bit mono you'd still have to use some compression,
coz' even 28k8 modems can't handle 4 kb/second plus package overhead...
But this could probably be some fast lossy assembly code, so theoretically
it is possible...

Maybe, but I'd bet not more than 2 of these 9 use menu_popup(), but their
own routines, because the popus should work with older AESes as well.

> So, registers D2 and A2 must be saved by your routine before a BIOS/XBIOS call.
The same applies to GEMDOS-calls, though it's wise to save a2 inside routines
hooked into GEMDOS or (X)BIOS, as some buggy software relies on a2 not being
altered (which is true for most original GEMDOS-calls, but not documented).
An example is Pure C, which can't access its help files anymore if a2 is
altered during a GEMDOS call ...

> Another problem bites the dust!
What I wanted to say with "may or may not work" was, that Dopendir() _will_
work with certain CD-ROM drivers, so it may be a workaround for your problem,
but it's not a real method to detect a CD-ROM. Anyway, a crash due to calling
Dpathconf() is either a problem of the driver or the kernel and should be
checked. Do you have any more information about that crash?

> as some OS XBIOS calls also uses D2 and A2 besides D0-D1/A0-A1 he should
> be free to use them as well. That's what I was telling him...
I must admit that I first wanted to write the same, but then I read the
original question again and got unsure. Gaven asked if more registers are
deemed scratch and therefore have to be saved by his code (which apparently
means the code calling his XBIOS-interface), so D2/A2 may be used freely
inside an XBIOS routine and therefore have to be saved before calling the
XBIOS from within an application.

Of course, Roland and I may have misunderstood Gaven's question, but to be
honest I think it's a bit ambigous (which I hope my answer isn't) ;)

5159. !!!!!!!!!!!!!!!

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-02 00:00:00 UTC
From: hinda ann kolansky <ayala20@prodigy.net>
Message-ID: <5kd56j$5sm$7257@newssvr07-int.news.prodigy.com>
Source record: 7010

****Make up to $50,000 in 4 weeks! 100% leagal**** NO SCAM!!!

Make $50,000 in 4 weeks!

This system works! NOT A SCAM... Read the text!

This is the fairest, most honest way I have seen to share in the wealth of the world! This works so well that all of my friends are trying it!

Take five minutes to read this and it IT'LL change your life if you want to know how to make thousands of dollars quickly, and leagally with NO CATCH, then keep reading.

THe internet has grown tremendously. it doubles in size every 4 months.

Think about it. YOu see those "make money fast" postings more and more.

Thats becasue it works! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5 and a little effort on your behalf?? Everyone was calling it a scam, but there are soany new users from AOL, NETCOM, etc. that they will join in and make it work for you.

just follow these simple steps:

STEP ONE
Invest your $5 by writing your name and address on five seperate sheets of paper along wit the words: "PLEASE ADD ME TO YOUR MAILING LIST." (in this way you are not just sending a dollar bill to someone, you are paying for a legimate service.) Also on each of the sheets of paper indicate the number of the person. Fold a $1 bill inside each piece of paper with your name and address on it. Ensure that when the dollar is folded in between the paper and it is held up to light, THE DOLLAR SHOULD NOT BE VISABLE! Mail 5 of these letters to the following 5 addresses: (only U.S. Dollar bills should be used)

1) Odd Hilsen
Avda Espana 93
Sitio de Calahonda
Mijias Costa- Malaga SPAIN

2) Peter Kjoge
Camino de la Condesa 9, 5-A
E-29640 Fuengirola SPAIN

3) Bob Tomlinson
3208 21st
Sioux City, La 51105 USA

4) Alex Tikhanoff
1636 n. Verdugo rd.
Glendale Ca. 91208 apt.202

USA
5) hinda kolansky
49-35 167 st
flushing ny 11365 usa

STEP TWO
Now remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so o. Put your name as the fifth one on the list.

STEP 3
Post the article to at least 250 newsgroups. There are at least 19000 newsgroups at any given moment in time. Try posting to as many newsgroups as you can. Remember, the more newsgroups you post to, the greater your audience and cash flow from all these subscribers.

STEP 4
You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the internet is new and awesome in its size. There is no way you can lose.

now here is how and why the system works:

Out of every block of 250 posts i made, i got back 5 responses. YES! THATS RIGHT ONLY 5. You make $5 in cash, not check or money orders, but real cash with your name at #5.

Each additional person who sent you $1 now will also make 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1 with your name at #4....$50 in your pocket!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average returns, 500 people=$500.00. they make 250 postings each with your name at #2=100,000 postings=5000 returns at $1 each=$5,000 in cash!!
Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $50,000 before your name is dropped from the list. And thats only if everyone down the line makes 250 postings each! Your total income for this cycle is $50,000.00

When you see your name is no longer on the list, you take the latest posting and start all over again.

The end result depends largely on you. You must follow through and repost this article everywhere you can think of! The more postings you make, the more cash ends up in your mailbox. Its too easy and too cheap to pass up!!

So thats it. Pretty simple sounding working concept, dont you think?

But believe me, this really works. There are millions o people surfind the net every day, all day, all over the world. And 100,000 new subscribers everday eager to access your newsgroup. Youknow that because you have read the facts in the newspaper and seen for yourself on T.V. So, my dear little 'fortne seeker.' read carefully the instructions and play fair and swuare with your endeavors.. remember, YOU CAN ONLY TAKE OUT WHAT YOU PUT IN!! thats the key to success in any venture. Print these pages out now so that you may refer to this article at a later date. try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be!

REMEMBER....HONESTY IS THE BEST POLICY. YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE BIG BUCKS!! GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOUW ILL BE MORE THAN GENEROUSLY

REWARDED!

P.S. if you try to decieve people by posting the messages with your name in the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only got about $150 (and thats after 2 months) then he sent the five bills and was added to their lists. In 4-5 weeks, he had in excess of $10,000.

Good luck!

CVTranslator(Carlos Varelas) is pretty good, but slow.
you can edit the dictionary, double clicking on the German word
brings up a dialog box where you can type in the english equivalent,
which is then saved in a dictionary to be used next time.

The simplest way is to turn OFF "WP Mode" in the Edit menu and then save as an ASCII file.

There are some utility programs which will convert Word+ files to Word and WordPerfect format preserving text effects. I hope others will give you the identities of these progs.

I have made a program that converts Wrodplus files into ASCII-format for use in for instance MS Word. There are several other programs out somewhere that does the same thing. If you can not find any program, please contact me and I will send you my program. If you have got access to Internet, I could send the file by E-mail or on my Website. Otherwise I can send a diskette.

Yours sincerely

E-Mail Your Way To Riches!

Dear Friend,

We all know E-mail is here to stay. It's fun, easy and exciting! Would you be interested if we could show you a way to make well over $1,000 per week doing it?

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took! My part-time business is now a full-time home-business, thanks to your

Creative E-mail System. I had to hire my two family members to help me out!
This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Many of other people's databases are filled with duplicate addresses and many of them are undeliverable. We keep our own database so we know exactly what we have and we keep nothing but the best. There's no other way. We believe in producing high quality products that should be priced reasonably for your success! Read on to see the special bonuses you will receive.

******** SPECIAL 10 DAY BONUS ********

If you order within the next 10 days we will include:

1) 500 How-To Reports (You may resell these at any price)

2) Your Personal Complete Guide To The Internet -- This 175 page e-book covers every single aspect of the internet. You will never have to buy another internet book! When you complete this book, you will know more about the internet than 90% of the people online right now.

3) When you purchase our 8 MILLION SUPER responsive E-mail list we will include Mega-Mailer. It sends 250,000 E-mails per hour! All other orders will receive Pegasus Mail. It mails about 30,000 per hour.

Here's how to get the Creative E-Mail System:

All orders are delivered on CD-ROM or 100mb Zip Disk (Iomega).

============> E-Mail Databases <================

2 Million FRESH E-mail Addresses only $ 99.95
4 Million FRESH E-mail Addresses only $179.95
6 Million FRESH E-mail Addresses only $249.95
8 Million FRESH E-mail Addresses only $299.95

You will be sending your Marketing Letter to 2, 4, 6 or 8 MILLION People! To mail to 2 MILLION People by U.S. Mail at $.32 per stamp would cost $640,000.00, not including envelopes or paper! The price of 2 MILLION E-mail Addresses isn't even a fraction of the cost. And the great thing is that if you have 10 products, you can E-mail to your list as many times as you want to! Your profits will never stop soaring! Don't pay someone else to send your

advertisement out, do it yourself and save big money! The average cost right now to send your ad one time to ONE MILLION people is $1,400.00. You can send it 100 times to EIGHT MILLION people for only $299.95 and that includes Mega-Mailer that sends 250,000 per hour!

==========> Order Form <==========

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took! My part-time business is now a full-time home-business, thanks to your

Creative E-mail System. I had to hire my two family members to help me out!
This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Many of other people's databases are filled with duplicate addresses and many of them are undeliverable. We keep our own database so we know exactly what we have and we keep nothing but the best. There's no other way. We believe in producing high quality products that should be priced reasonably for your success! Read on to see the special bonuses you will receive.

******** SPECIAL 10 DAY BONUS ********

If you order within the next 10 days we will include:

1) 500 How-To Reports (You may resell these at any price)

2) Your Personal Complete Guide To The Internet -- This 175 page e-book covers every single aspect of the internet. You will never have to buy another internet book! When you complete this book, you will know more about the internet than 90% of the people online right now.

3) When you purchase our 8 MILLION SUPER responsive E-mail list we will include Mega-Mailer. It sends 250,000 E-mails per hour! All other orders will receive Pegasus Mail. It mails about 30,000 per hour.

Here's how to get the Creative E-Mail System:

All orders are delivered on CD-ROM or 100mb Zip Disk (Iomega).

============> E-Mail Databases <================

2 Million FRESH E-mail Addresses only $ 99.95
4 Million FRESH E-mail Addresses only $179.95
6 Million FRESH E-mail Addresses only $249.95
8 Million FRESH E-mail Addresses only $299.95

You will be sending your Marketing Letter to 2, 4, 6 or 8 MILLION People! To mail to 2 MILLION People by U.S. Mail at $.32 per stamp would cost $640,000.00, not including envelopes or paper! The price of 2 MILLION E-mail Addresses isn't even a fraction of the cost. And the great thing is that if you have 10 products, you can E-mail to your list as many times as you want to! Your profits will never stop soaring! Don't pay someone else to send your

advertisement out, do it yourself and save big money! The average cost right now to send your ad one time to ONE MILLION people is $1,400.00. You can send it 100 times to EIGHT MILLION people for only $299.95 and that includes Mega-Mailer that sends 250,000 per hour!

==========> Order Form <==========

Yes, Internet Communications Inc., I wish to take you up on your SPECIAL 10 DAY OFFER FOR YOUR CREATIVE E-MAIL SYSTEM, INCLUDING THE TWO SPECIAL BONUSES: "Complete Internet Guide Book" and "500 How-To-Reports". I understand I have to completely fill out the order form so you can fulfill my order.

Is there an easy way to convert VDI palette index colors to Shifter colors
(ie. the ones in the actal bitmap) and vice versa?
I need to do this for a collection of prlotting routines that I use in
combination with the normal VDI routines (coz' as far as I know the VDI has
no fast plotting routine...)

Thanx...

Hello!

Another Idea:
Plot your points in memory bitmaps and then blit them with
vdi_copy_raster onto screen, perhaps line per line. Excellent for
rectangle areas.

I was a bit ambiguous. Sorry.

What I meant was : "A0-A1/D0-D1/FP0-FP1 are scratch registers, are there
any more I can freely use without saving"?

From the answers generated so far, I beleve that D2 and A2 are scratch
registers used within XBIOS/GEMDOS calls (and I presume, BIOS calls as
well).

(BTW: Full marks to you for correctly spelling my name. Most people
mis-spell it as "Gavin". You correctly spelled it as "Gaven")

>What I wanted to say with "may or may not work" was, that Dopendir() _will_
>work with certain CD-ROM drivers, so it may be a workaround for your problem,
>but it's not a real method to detect a CD-ROM.
Yes, understood. I wasn't wanting to detect a CDROM as such, but just stop
my program from crashing when a Dpathconf() call failed. Checking the path
exists with Dopendir() first seems to work... so far :-)

>Anyway, a crash due to calling Dpathconf() is either a problem of the driver
>or the kernel and should be checked.
I agree that a crash isn't a good way to go about failing the call :-)
The driver was ExtenDOS Pro.

>Do you have any more information about that crash?
No, other than a Magic '68000 exception error' whatever that is. From what I
understand of that error message, it doesn't tell you much and often isn't
related to the underlying problem.

Yeah, but I'd need something to plot them with, wouldn't I?
That's where my little routine comes in handy. There's just one
problem: it writes directly into the bitmap, and as the shifter
palette indices seem to differ from those used by the VDI, I'd need
some way of converting them into eachother...

5176. Re: Toolbox API: Detecting the Toolbox

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-08 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <587cd$1180.2f5@HERMES>
Source record: 7027

In order to detect the Toolbox, you will need to call the Toolbox ID function via the XBIOS interface.

If the Toolbox does not exist, the XBIOS will return an error code equal to the XBIOS function number.

If it does exist, it will return 'TLBX' in data register zero.

The XBIOS function number through which you communicate with the Toolbox is number $7462 ('tb' in ascii, or 29794 decimal).

To call the ID function within the Toolbox, you pass a 32 bit function number of zero as a parameter.

So, the entire detection code looks like this:

```
xtlbxID:
clr.l -(sp) ; tlbxID()
move.w #'tb',-(sp) ; XBIOS interface to TLBX
trap #14 ; call XBIOS
addq.w #2+4,sp ; clear stack
cmp.l #'TLBX',d0 ; does it exist?
bne not_exist ; nope, so do something else...
```

Previous versions of the Toolbox installed a 'TLBX' cookie in the cookie jar, but the "data" portion of the cookie was altered frequently, and should not be relied upon.

All Toolbox calls are normally via "TRAP #0", however, as some debuggers (like Hisoft's MON that accompanies Lattice C, Devpac, and Hisoft Basic) like to reprogram the Trap #0 vector to point to their own "invalid trap" handler, the ID function will also reprogram the vector to point to the correct place. This is why you should use the xtlbxID() function above to detect it. This function has recently been introduced as the only legal means of detecting the Toolbox.

If you own Lattice C, and wish to inline xtlbxID() in your apps, simply add the following lines to your TLBX.H file

```
#include "0/types.h"

uint32 _xtlbxID(uint16,uint32);
uint32 _tlbxID(uint32);

#define _XTLBX {register d2,a2; "4e4e";}
#define _TLBX { "70007210204022404e40";}
```

```
#pragma inline d0=_xtlbxID((short),) _XTLBX
#pragma inline d0=>tlbxID() _TLBX

#define xtlbxID() _xtlbxID('tb',0x000)
#define tlbxID() _tlbxID(0x000)
```

, and then you can just detect the Toolbox like this:

```
#include "0/tlbx.h"

int main( int argc, char *argv[] )
{
if( xtlbxID() != 'TLBX' ) {
printf( "TLBX not available\n" );
return errorNoToolbox;
}

..
}
```

I'll be uploading the Toolbox to an FTP site or perhaps an Atari binaries newsgroup shortly.

If you have any questions or comments, feel free to follow up the Toolbox API threads.

5177. The Shotgun BBS Secret Is Finally Out!!!

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-08 00:00:00 UTC
From: tony.campbell@fidonet.org
Message-ID: <577cd$142d23.1dd@NEWS>
Source record: 7028

This archive was created to show you how the proprietary graphics protocol
used by Shotgun BBS actually works. Yes people, the secret is out, no more
trying to hide Shotgun's limitations, you can now see why there are no SVGA
doors written for Shotgun. It is simply because of the lack of forethought
and good planning by the author. Everything in this archive is written for
Borland/Turbo Pascal v7.0

The BBSLIST.PAS is the main program source code for an example BBS
listing door for Shotgun. Its simple, and shows you exactly what a
person can actually do with SVGA doors and Shotgun. That is "Very
Little", sad, but true. The chances of Shotgun's graphics protocol
ever becoming adopted as a standard are slim to absolutely none.

The YAPPKIT.PAS is the unit file that shows how Shotgun BBS handles
screens and parses keypresses. If you don't use Async Professional,
you will no doubt have to make major modifications to this file!

To recompile the SG screens to GIP screens, use the -REALNAME switch
at the end of the command line for PAKGIP.EXE or it won't work! You
can't just renmame the file!

I need Software developers who can program highly advanced graphic programs.
The Software needs to run on Unix Workstations and Windows NT/95 environment.

It is not a one person project. You will be working with multiple people.
So you have to know(or learn fast) how to work in a team.
It doesn't matter were you live. 'Cause we can have contact through the Internet.

If you think you can do this, PLease ReMail this message and tell me something
about yourself and your work(not neccesary). And I will send you some more information.

Sincerely

Ruben Daniels

The CAD industry is a very delicate industry.
Everything has to be precies sometimes as precise as a 10th or 1/100 of a mm.
This is iin some case impossible to do with a computer cad program.

Companies that have these problems for instance people in the designing industry have to make everything perfect.
For them is it impossible and much to time costly to use a computer fo this purpose.

Well I have got the best thing for you.

It is an machine developed in Denmark.
There is still only one prototype of it.
It is a laser wich can scan any object and make it into a dxf format file.

Of course you can see that this machine has unlimited possiblities to use it.

We offer now, 'cause we still have to refine and test it, a free use of the machine.
The only thing you have to pay are the transportation of the object you want to scan to send to Denmark.

It has an accuracy of about 1/10 mm but if the machine is ajusted just right it cen be even more accurate.
In the future we expect it to be as accurate as 1/100 of a mm.

Of course the objects cannot be very large. If they are they must scanned in a couple of times.
Of course this is no problem.

It can save tens of thousands of dollars because else someone had to make it with the computer which is impossible to do with a precision of a 10th mm.

The speed of this machine is incredible of course you can control this but it can be done in 5 minutes. Of course the scan will be better if you let it take more time to scan.

Please remail this message for more information. Please tell me what kind of object you want to use it with etc. If you want to make use of the testing we will bring you in contact with the developer of the 3D laser.

When you remail lthis message please answer the following questions.

Thank you

- If this machine was brought to the market what would you be willing to pay for it?

$10.000 - $20.000
$20.000 - $30.000
$30.000 - $40.000
$40.000 - $50.000
Another value please type it yourself

- What would you use it for and what do you think it can be used for?

- Do you know people who could use this product? (Do you want us to contact them)

Sincerely

Ruben Daniels

> registers used within XBIOS/GEMDOS calls (and I presume, BIOS calls as
> well).
Yes, D2 and A2 may be used freely within (X)BIOS- and GEMDOS-calls, but
as I've already mentioned, it's wise to save at least A2 within GEMDOS
calls, as some older software relies on the (undocumented) behaviour of
all built-in GEMDOS-calls not altering A2.

IIRC, FPU registers aren't used in any operating systems calls and there
are no reliable docs whether you may use them or not. So, I'd assume
all FPU registers have to be preserved within an additional operating
system call. If you don't need them anyway, don't care about them.

> (BTW: Full marks to you for correctly spelling my name. Most people
> mis-spell it as "Gavin". You correctly spelled it as "Gaven")
Well, IMO it's not that hard to read and write names correctly, as long
as they're not too unusual, which I'd say Gaven isn't for sure ;)

Ciao

Thomas

Hi, we'll get right to the point. We operate one of the finest
quality custom color labs in the USA. To introduce you to our
service we're offering the following Internet enlargement special:

Your color negatives hand printed on Kodak Supra Professional
16x20 inch paper. All negatives printed full frame.
Exhibition quality and color corrected---send us any size color
negative (35mm up to 4x5 inches).

* * * * * * * * * *
16 x 20 inch color enlargement special
5 identical prints from same negative-------$79
10 identical prints from same negative------$129
* * * * * * * * * *

Most orders 1 to 2 days in the lab. Add $6 priority mail shipping;
international add $10. We accept Visa and Mastercharge.

Mail your negative(s) and payment to:

TSP CUSTOM LAB

Why not use EVNT_MULTI()? It should be able to give you mouse, keyboard
and message responds.

5191. Infusion BBS Software

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-11 00:00:00 UTC
From: Grant Passmore <skaboy@usa.net>
Message-ID: <33765d10.0@data.wt.net>
Source record: 7042

I just thought I'd let everyone know....

There is finally a BBS Software with all of the great features of OBV/2 and Iniquity, but without the bugs and bad
support. Infusion BBS Software is a new generation in BBS Software, modeled after OBV/2 and Iniquity with everything
that the sysop can imagine..and more.

Some basic features are:

o Multi-node upto 255 concurrent users
o Light-bar support [arrow keys]
o Requires NO Fossil Driver [selectable FOSSIL, ASYNC, and Digiboard for each node]
o Online Configuration [menu editor, string editor, evemt editor, node editor, system editor, etc]
o Pipe Color Codes
o MCI Codes
o Powerful scripting language
o Internal One-Liners, Blacklist, voting booth, etc
o Internal Z-Modem, X-Modem, Y-Modem, Y-modem-g [no limit to external protocols]
o Internal COMM Program with internal protocols, Auto Up/DL
o Great support
o Basically all of the great features of OBV/2 and Iniquity combined

Infusion has been picked up by fuEl [international art group], and Infusion 1.0th will be released June 10th.

Come to the Infusion Home-Page at http://web.wt.net/~sparky/ibbs/ and jump into the JAVA Based Chatroom,
or come to the ANNEX, the official Infusion IRC Server [irc.annex.net] #infusion / #bbs

send the author skaboy101 [Grant Passmore] E-mail at skaboy@usa.net

Talk about delayed response <g>!

The problem with EVNT_MULTI() is that, as I understand, it doesn't return until something happens. I needed continuous information as to the location of the mouse.

Anyway, problem solved--for me. I'm just using GFA BASIC's own MOUSEX and MOUSEY calls, which probably use Line-A routines. Yes, I know that's not the cool thing to do. I'll be able to check my program on a Falcon to see if there are problems. Of course, I pprobably won't be able to do anything about it if there are!

Don't know any offhand but they're out there.

> Is there any good freeware/shareware?

Have you looked? What kind of stuff do you want? I've written some apps for dealing with MY gear and software: An Akai S900 program editor, Korg M3R "combi consolidator" and "combi copier", a program to translate 9-pin printer dumps from Dr T's COPYIST (notation) program into graphic files and edit them, another to create/edit Copyist user symbols, a small utility to send big sysex files, and a few others I've forgotten about. I'm now working on a program for my latest synth, a Roland XP-50.

> Is there anything else you want to tell me about MIDI programming?

Not at the moment.

> Which language should I use...C...?

Which language do you use now? I use GFA BASIC which works quite well. I would imagine that there are C libraries that can do it just as well.
>
> Please, give me some good advice.

Start programming and post with more specific questions! It worked for me!

Just set EVNT_MULTI to wait for timer events and set the timer to a very
short value. The mouse coordinates will always have the current values,
no matter what event triggered the exit from EVNT_MULTI...

You can get a TIMER message to solve this.
Set the TIMER event to for example 15 (15 ms)
then when you recieve the timer message you also
get the mouse position and state.

Hi,
In assembly language I need to be able to find out both the total amount
of free memory, and the size of the largest free block.
I know I can use malloc with a size of -1, but which of the two sizes does
it return, and how can I find out the other.

The GEMDOS Malloc() call (not to be confused with the malloc() call that
is part of most C libraries) returns the size of the largest block when
passed a value of -1L.

There is no "good" way to find out the total amount of free RAM, other
than to Malloc(Malloc(-1L)) repeatedly until you run out of memory. Oh,
and don't forget to free these blocks up afterward, preferably in the
reverse of the order you allocated them. I use a linked list to do this.

5198. Hisoft Basic prob for beginner programmer

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-12 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <5l81a7$3j4$1@roch.zetnet.co.uk>
Source record: 6952

Hi People,
Forgive the no-nothing nature of this posting, but......
I find myself in need of a rather wierd utility that doesn't yet exist, so have decided I'll have to program it myself. Unfortunately what I know about programming could be written in large type on a postcard <g>
I'm using Hisoft Basic to do this, although I guess I could use Personal Pascal or Hisoft C if needed as I think I have both of them somewhere in my disc collection.
The problem is I've got an ASCII file that represents half wave-cycles of eight-bit audio, I want to teurn them into full-wave cycles, by splitting them up and inserting extra half-waves of a repeated but inverted type. ie I need to load each separate half-wave, invert each byte by taking it away from 255 and then stitching the two half-waves together. Each half wave is 64 bytes long, and is in a raw ASCII file. The whole file is 8K long, and has 128 separate half-waves in it. If stitching it together to make the final file is too hard, I could live with having a file of just the inverted data, although I'd rather not. I'm a bit stuck as the file is not comma-delimited in the way that would be normal for the old Basic DATA statement.
The process that has me stuck is loading an individual byte from an undelimited file, proccessing it is OK, I can use the ASC and CHR$ things, but stitching the two sub-files together onto the end of the final file is beyond me too at this point.
Unfortunately the Hisoft Manual (Another reason for using Basic is I have a real manual, the others are cover-disc give-aways) goes straight from a really simple <For a = 1 to 10>, <Print a> kind of thing into something about the Towers of Hanoi game (rings on poles)
I've thought of several ways of doing the load, if there was some way of erasing the first character in the file then I could cut each one off after processing and ASC would get me the value of the first character. I could then use that to generate each 64-byte chunk of the half wave, but I'd need some sort of sequential file-writer to do it with, use CHR$ and a similar sequential technique to generate the inverted side of the wave, then stitch each half wave together in order, as a final file...
I don't need graphics, this is a one shot to convert one file, but parts of it might come in handy again. In case you're wondering the files are wavetables from an old synthesiser that used these half-waves as raw sounds, in order to access the sounds we'd like to have full waves as it makes the decoding easier with normal electronics.
Many thanks in advance for any help you can provide, please reply via

email rather than the group, I guess very few others will be interested in watching my faltering steps being corrected <g> also, my news access can be a bit flaky at times, zetnet frequently seem to run several days adrift...

...

sounds like a job for perl :) Is their a version of Perl for TOS?
how usable is it? If you can't get it for the Atari, do it on a unix
box. mucho easier.

btw- why exacly do you need full waves cycles? Was the positive or
negative polarity clipped from the recording? You might have trouble
reproducing the original waveform.

^^^^^^^

(I assume that this was a typo. _GEM_ is called via TRAP #2, whereas _GEMDOS_ is called via TRAP #1)

I use the Compendium book as a reference to the system calls I may use once every three millennium. (However, I'd have liked it to be a lie-flat [ring-bound] book. Admittedly that may be difficult with a book of 900-odd pages)

You should never use the FPU inside the OS calls. There will be all kind
of problems if you try to, eg., exceptions may only be reported at the
next fpu insn, so you might get one from the last fpu insn executed in
user mode. At least you should save and restore the *whole* fpu context
(fsave/frestore + fmovem for all fpu registers) around any use of the fpu
inside the OS call. Or better, don't use it at all.

Thanks, Erik and Vegard, for suggesting the use of a timer to exit the EVNT_MULTI() call. I'll give it a try but I'm not too optimistic. The function I used at one point (I forget if it was AES or VDI) was too slow for me--the mouse pointer flickered badly. The GFA MOUSEX and MOUSEY calls are much, much faster--probably because they directly access Line-A.

Rob Aries

s > block. I know I can use malloc with a size of -1, but which of
s > the two sizes does it return, and how can I find out the other.

Malloc(-1) returns the size of the largest free block. To get the
total amount of free RAM, one must loop over all the remaining free
blocks. The C code for this would be

long free_ram(void) {
long size,total,last;
long *p;

last = total = 0L;
while((size = Malloc(-1)) >= 4) {
total += size;
p = Malloc(size);
if(!p) break; /* this should never happen! */
*p = last;
last = (long) p;
}
while(last) {
p = (long*) last;
last = *p;
Mfree(p);
}
return(total);
}

If you can't read C, I could translate this into assembly (but don't
particularly want to).

l > versa?

For 4 color and 16 color modes you can create a lookup table using
the published values. For 256 color mode, the best method is to
draw all 256 colors to the screen using color indexes then examine
the resulting bit maps values using v_get_pixel().

>What I meant was : "A0-A1/D0-D1/FP0-FP1 are scratch registers, are there
>any more I can freely use without saving"?

Well, I think that, in the various messages that Thomas and I posted, you have
got a clear picture now, Gaven.
However, there is still a point that I would like to precise.

The FACT is that (X)BIOS and GEMDOS calls may destroy D0-D2/A0-A2. Now, how
to behave knowing that depends on what you want to do:
(1) If you want to write your own stand-alone assembly code making (X)BIOS calls,
it is up to you to keep valuable data in any of D0-D2/A0-A2, and to save them when
making the (X)BIOS calls.
(2) If your assembly code is one piece of a larger program, in C, say, then you
must conform to the PROGRAMMING MODEL of your compiler. In Lattice C, for example,
only D0-D1/A0-A1 are allowed to be destroyed by a routine. In this case, your
assembly code must save D2/A2 upon entry and restore them upon return, IF your code
makes any (X)BIOS/GEMDOS call, that is, even if you don't play with these registers
yourself. Failure to do this systematically may lead to a crash of the routine which
called yours.

Cheers.

Roland (prajoux@laas.fr)

No real need to, but if you do, you will see that in 256 colour mode, the first 16 colours are ordered the same way as in 16 colour mode, and the other 240 colours are in the same order in VDI as in the Shifter.

Note that

a) Malloc(Malloc(-1L)) may fail in multitasking environments

and

b) it's a good idea to call such a function via Supexec(), as both MiNT
and MagiC disable taskswitching in supervisor mode, so a) won't
happen. Of course, this may not hold true for future versions of other
multitasking environments.

Ciao

May I ask what you want to do? I wrote a little accessory some time ago
which writes the current mouse position into a window frequently. To
avoid flickering of the mouse pointer for such things, it's a good idea
to check if the mouse pointer is inside the rectangle which is affected
by the drawing before switching it off (of course, add some buffer area
around the rectangle). If it's an AES call, though, you can't influence
if it hides the mouse or not.

Ciao

Under MiNT it's also possible to find out the total amount of free
memory directly, by doing a Dfree() call on U:\PROC (i.e. have your
program change directory to U:\PROC and then do a Dfree() on drive
U:). This has the advantages of being an atomic operation, of not
shutting out multitasking, and not requiring the management of the
list of free blocks; but the disadvantage of not working under ordinary
TOS. (I'm not sure if MagiC supports this or not.)

I present here my two most recent software which I hope they interest you.
they are progammed by Turbo C++ and run under Windows(3.11 and 95).
here is a short description of these two software.

1-Robot Spy 1.0
at my knowledge, this software is the first and the unique of its kind.
This software allow you to spy your friends who are on the net at the same time
of you, it permits to see exactly what they do on their screen, pixel by pixel,
anywhere, in the world, at the condition they are connected to the internet.
how does-it work?
it's simple, you send a file to the person you want to spy telling to him it's a
game or everythings else, the objectif is this person run the file. from this time,
a batch file is installed on his computor, and everytime this person use internet,
this batch connects him secretly on our server.
on your side, you , after the installation of the other part of the software every time
you want, you can connect on our server with your password and have the list of all the
persons who received your batch and who are connected at this time.
the only thing you have to do is to click on the name of the person you want to spy.
a window opens containing exactly the screen of the person spied, you can have
ten pictures per second with 256 colors, if you switch to balck and white mode you can
onbtain a real time sequence, approximatly 30 pictures by second.

Robot Mailer 1.1
The message you are reading presently is sent to more then 20,000 newsgroups with
this software. This program automates FreeAgent, and reach with a connection of 28,8 Kbauds
5,000 news per hours. It can also find a maximum of 50,000 e-mail adresses from internet
and
send a message in 4 or 5 hours. You can obtain with this sofware the most powerful tool of
mass transmittion on the internet.

Robot Spy 1.0.................20 US$
Robot Mailer 1.1.............20 US$
Both.............................30 US$

I'm sorry i can't accept credit card, but you can send an international money order to:

Ben Hedi Nassef
1481 Ste-Catherine est #7
Montreal, PQ, H2L-2H9
Canada

Don't forget to include your e-mail on a paper, you receice the software ordered in your
e-mail the day we receive the money order.

I would like to start by apologising to anyone who feels that this posting is not relevant to them. It has been sent to all newsgroups where those involved with either art, programming or production may read.

Before you think it does not apply to you, please read on....

Pelican Consultants are currently working with developers and publishers of interactive entertainment. Our clients are based in the UK and USA and we are currently looking to recruit people who are regarded as being at the top of their profession.

Here is an example of who we are looking for:

Programmers with Artificial Intelligence experience - UK
Internal Development Manager - London and North UK
Head of Game Development - US - West and East Coast
Producers - North UK, London
Playstation Programmers - UK and US
Windows 95 Programmers with C and C++ - USA
Designers - UK
Storyboard Artists - London
Console Developers - USA and North UK
Graduate Programmers - London
3D Artists - London, North UK, USA
2D Artists - London, West UK
Head of Studio - UK

This represents only a small selection of positions on offer, and there are many more which we would like to discuss. Salaries range from £15,000 Sterling to $200,000 US.

These positions are genuine - we do not advertise fictional positions to attract business. Many of our clients have retained our services exclusively to identify these people.

We can guarantee that your interest will be met with discretion and that we wil take the time to discuss exactly what it is you want for your career. Our candidates are not placed on the 'open job market' but are regularly advised of opportunities which may suit them.

For an initial discussion, please call our Development Consultant - Paul Rose on (+44) 181 423 3400.

You can also email your resume to pjrose@pelican-consultants.co.uk or fax him on (+44) 181 423 1117.

We look forward to hearing from you soon.

In my program, there are 4 lists of 12-character names displayed in
four
boxes on the screen. There are a total of 320 names displayed (I use
ST-
high rez with 4-pixel-high letters). I "select" these names by
left-clicking
and dragging the mouse over them. When the left button is down, I need
the x and y coordinates so I can figure out which name is clicked on.
Using
any call other than the GFA MOUSEX and MOUSEY, the mouse flickered
badly while it was held down.

Actually, it's been so long that I forgot if one of those calls (AES or
VDI) *did* work OK (no flickering), except that the mouse position could
not be read when the mouse was in the upper 19 pixels of the
screen--this is
normally the area for the menu bar, except my program has NO menu bar--I
need the *entire* screen to display all 320 names! I think that was the
problem that forced me to go back to using the GFA (Line-A) calls.

Hello, I'd like a copy of Cubase 3.0 for the ST. I don't need the manuals
(used Cubase for many years).

Could also trade (Softsynth,Avalon,etc..)

Thanks for your time.

I cannot believe it !
I must work hard and pay lots of money for cubase software and you will get
a illegal copy - or what ?
Forget it - buy your stuff and stop beeing an unsocial guy. The fact is:
the more illegal copies where in use, the higher the prices for legal
customers. Fuck Piracy !
Hope, you understand my very poor english (8-|)

For my PCs I have accquired an Iomgea ZIP paralell port drive.
Now I would like to connect the drive to my Atari Falcon 030.
Does anybody know where I can get the necessary software, driver and
tools?
I am using the original TOS GEM delivered with the falcon.

> [...]
Mhmm, why not use wind_update(BEG_MCTRL) before starting the drag
operation and call wind_update(END_MCTRL) afterwards? This would allow
you to use mouse rectangle events that only occur if the mouse has really
been moved. In that case, you can use a faster AES call and still receive
the coordinates, so you'll still be able to react on mouse movement. But
when the mouse is still, nothing will happen, so it won't flicker. Of
course, if you need to draw something even when the mouse is still, this
is not practicable for you.

But in that case, evnt_multi() with 1ms timer events should be OK, as
this call also does not make the mouse disappear. It will only disappear
if you call some AES function like objc_draw(), which have to ensure that
they don't overwrite the mouse cursor. Also, no VDI drawing primitve
cares for the mouse pointer (that's why you have to switch it off with
graf_mouse() yourself before drawing to the screen), so you probably used
some AES call to draw stuff.

Ciao

Thomas

Hi!

In article <5lq28deib1@kalle.tninet.se>,
tpollak@aristotle.algonet.se (Tommy Pollak) writes:
> For my PCs I have accquired an Iomgea ZIP paralell port drive.
> Now I would like to connect the drive to my Atari Falcon 030.
> Does anybody know where I can get the necessary software, driver and
> tools?
Even though that's a FAQ: It is not possible to use a parallel port Zip
on any Atari, as the Atari's parallel interface lacks some signals
necessary for that. But even if it provided them, I don't think there
would be the software you need for it, as Iomega wouldn't give details on
how it works (not regarding that the speed wouldn't be too useable).

So, if you want to use a Zip on the Falcon, get the SCSI version (internal
or external). Also, if you want to use the special features of the Zip
drive, like password protection, get HDDriver, which currently is the only
harddisk driver that can do this (a demo version is available from
ftp://acp5.chemie.uni-kl.de/pub/atari/).

Note that you need a special adaptor to connect the external SCSI Zip to
Ataris, as it only ships with a Mac SCSI cable. Also note that the
internal version comes with a PC ISA hostadaptor and a tool disk for
Mac/PC, which both are of no use for the Atari. So you might consider
getting the "bulk" version.

Ciao

Thomas

Thomas,

Thanks for these suggestions. Remember, though, I'm a GFA-BASIC person
<g>! A lot of what you said is not clear to me yet. I have the Atari
Compendium, so hopefully I'll have a better understanding after doing
some reading.

Robert

Hello,

Roni Music Home Page offers free down load of the Sweet Sixteen MIDI
Sequencer for Atari computers.

Sweet Sixteen is a comprehensive and powerful MIDI sequencer for
PC/Windows and
Atari ST/STE range of computers.
Sweet Sixteen offers Piano Roll, List and Transform edit pages as well
as a
dedicated Mixer page you can use for your favourite synthesizer.

Three versions are available:
1. A shareware version which is a complete version of Sweet Sixteen
which you may try out for 30 days.
2. A demo version which is a complete version of Sweet Sixteen with all
file saving disabled.
3. A "lite" version which lets the user save files but certain other
functions are disabled.

Check it out at: http://home1.swipnet.se/~w-11396

Sweet Sixteen is $ 29.95 US

Forget it! No tools avaiable.
For atari machines only scsi zip devices.
No paralell drivers avaiable..

(HDDriver 6.2x for scsi versions)

5245. VDI plotting

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-21 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <5lungp$fit@balaena.bio.vu.nl>
Source record: 6799

Hi everyone,
I've got another one of those silly VDI questions...

I need to write a routine that will plot pixels (or an entire row of pixels
at once) using the VDI in any video mode. As I see it, I have two options:

1 - Use v_pline to draw each pixel seperately. Sounds a bit slow...
2 - Build a bitmap in standard format and then use the VDI transform
function. At first this sounds a bit more advanced then the method
described above, but... What is the format of a standard bitmap
for, say, 24 bit pixels? If it is what I fear it is (24 seperate lines,
one for each bit) then that would mean that, in order to write 16 pixels
in a row, I would have to read 16*3 = 48 bytes (to get the color values
in RGB) and write 24 words (again 48 bytes) which
a) need lots of shifting, ANDing and ORing, which uses up a lot of
CPU cycles
b) don't fit into the registers, so would have to be constructed in
memory (which is awfully slow when using ST-RAM)
All this would make it even slower than a single-pixel plot routine
for an 8-bit interleaved screen :-) (Yes, I've got a Falcon, which uses
this silly mode that only Atari (or Amiga) could have invented...)
(Well, not exactly invented, but thought handy enough to put into their
video hardware anyway...)

Well, anyone else got any better ideas on how to use the VDI for fast
flexible plotting? Or is it just not possible... (I suspect the latter ;)

Hi everyone,
I've got another one of those silly VDI questions...

I need to write a routine that will plot pixels (or an entire row of pixels
at once) using the VDI in any video mode. As I see it, I have two options:

1 - Use v_pline to draw each pixel seperately. Sounds a bit slow...
2 - Build a bitmap in standard format and then use the VDI transform
function. At first this sounds a bit more advanced then the method
described above, but... What is the format of a standard bitmap
for, say, 24 bit pixels? If it is what I fear it is (24 seperate lines,
one for each bit) then that would mean that, in order to write 16 pixels
in a row, I would have to read 16*3 = 48 bytes (to get the color values
in RGB) and write 24 words (again 48 bytes) which
a) need lots of shifting, ANDing and ORing, which uses up a lot of
CPU cycles
b) don't fit into the registers, so would have to be constructed in
memory (which is awfully slow when using ST-RAM)
All this would make it even slower than a single-pixel plot routine
for an 8-bit interleaved screen :-) (Yes, I've got a Falcon, which uses
this silly mode that only Atari (or Amiga) could have invented...)
(Well, not exactly invented, but thought handy enough to put into their
video hardware anyway...)

Well, anyone else got any better ideas on how to use the VDI for fast
flexible plotting? Or is it just not possible... (I suspect the latter ;)

Don't forget that this is only true for the 68000. On > 68000, the vector
number is also stored on the stack (IIRC in step 4b, but I may be wrong).
That's why old trap handling programs didn't work on the TT, if they
expected parameters on the stack.

Ciao

Thomas

>: been moved.
> And how does one do that?
Mhmm, I can't promise everything I tell you will work flawlessly with
Gfa-Basic as well, but at least it should be possible to achieve it.

First, call wind_update(BEG_MCTRL) to grab the complete mouse control.
Then get the current mouse position by a call to evnt_multi() with a 1 ms
timer-event (MU_TIMER), which will also give you the mouse coordinates.
After that, use evnt_multi() and wait for the release of the mouse button
the drag operation has been started with (MU_BUTTON), and for a
rectangle event (MU_M1) that occurs when the mouse cursor leaves a
rectangle with x = last mouse x-pos, y = last mouse y-pos, and w/h = 1.
If you get a button event, the loop is finished (don't forget to call
wind_update(END_MCTRL) afterwards). Otherwise, draw your stuff and use
the current x and y position of the mouse for the rectangle in the next
call to evnt_multi().

If you want some sample code (either C or Gfa), tell me, as I don't have
the evnt_multi()-docs here (respect to those who are able to remember all
the parameters) ...

> If I remember correctly, the GFA drawing commands also turn off the mouse.
> He probably used them.
Maybe. I only use Gfa to quickly test some algorithms, but not for real
programs. So I hardly ever use the graphic commands.

Ciao

Thomas

P.S.: You should check your newsreader or the server, as your posting
contained the complete article twice ... (It really seems to be a
problem of the server, as the second arcticle contains a mail
header with the subject "Local Post".)

1) A temporary copy is made of the SR.
2) The processor enters supervisor mode (changing the bit in the SR).
3) The PC is saved on the supervisor stack.
4) The copy of the previous SR is saved on the supervisor stack.
5) The vector is fetched from the appropriate place in memory.
6) The Program Counter is set to the contents of the vector.
7) Execution continues from the address in the PC.

All other registers remain unchanged (including the CCR), so it is up to the
trap handler to save and restore them as necessary.
Also, if I remember correctly, the trace flag in the SR is cleared during
the transition to supervisor mode.

As a matter of fact I just have the same problem. I wanted to use my //
Zip drive (initialy for my Pc) to save all my Atari files. I asked the
same questions two days ago, and I get the same answers everywhere.
So i transfered all files via null modem cable (with ZModem protocol) on
my Pc and then saved them on my Zip drive.

But perhaps there is a better solution i still didn't try :
- connect the Pc and the Falcon with a null modem cable,
- use Ghostlink to use Pc as a slave.
- consider all the Pc peripheral devices as Falcon peripherals.
Actually, I will try this idea this week-end, so if you do it before
tell me so.
If you have questions or suggestions about this procedure just tell me.

Wilfrid, FRANCE !

PS. If my English is quite incorrect, please forgive me and help me ...

Hello, I am interested in getting into assembler programming on the ST. I need to know where I can get information on programming the operating system and the hardware (not that I intend to program the hardware directly, it is more for interest).

I already have 68K programming experience with my Amiga so do not need any information on programming the machine code itself.

Thank you for your time.

This is a BAD thing for compatibility!
Thank you very much! I'll left the stack then and ask parameters by
registers! It will be compatible from the good old 68000 to the great
68060!

Start with the Atari Compendium...it covers all versions of TOS and is
available in book or CD-ROM (HTML format) form... Good luck, and have
fun! :)

Well, with TOS and compatible systems, there's no real need to do so, as you
can rely on the OS variable _longframe. If it's non-zero, than the
running CPU uses the long stack frame (i.e. with the vector number).

But don't forget to check if the trap was made from user or supervisor
mode, as the parameters have to be accessed via the USP, then.

Of course, if your trap handler is not intended to run under
TOS-compatible systems, you can't use _longframe. Btw, I don't have the
address of _longframe handy, but I can look it up. Or maybe someone else
can supply it.

Ciao

Thomas

Source record: 6814

```
b > what's EXACTLY happens when a TRAP is called

An exception stack frame is pushed onto the supervisor stack. For
the 68000, this consists of the status register and return address
(6 bytes). For the 68030, it also includes the exception vector
number (8 bytes total).

The CPU switches to supervisor mode (interrupt mode on the 68030)
and jumps to the address in the corresponding exception vector
(first 256 longs in RAM).

Remember that A7 now refers to the supervisor stack. You might also
have to worry about MMU effects to be compatible with MiNT and
possibly OUTSIDE (for 68030).

The RTE pops the exception stack frame, restoring the original
status and PC register values. Note: if you were already in
supervisor mode before the exception, you will still be in
supervisor mode after the RTE.

menu_attach() allows a submenu to be attached to a menu entry, so that
when the mouse pointer moves over that entry, the submenu appears. For
further information you may like to consult an up to date reference on the
Atari AES, such as the Atari Compendium.

Instead of ghostlink you should try Parcp, which is a similar tool but
uses the parallel-port instead. It also multitasks with Win95 and I
believe it's available for Linux as well. The downside here is that unless
you have two paralellports (Many PC's have.) you need some way to switch
between the Zip and Parcp's cable.

If you have more than one paralellport you can save directly to the Zip.

Hi!

In article <f3e_9705221318@conchbbs.com>,
John.Kormylo@7861.conchbbs.com (John Kormylo) writes:
> For the 68030, it also includes the exception vector
> number (8 bytes total).
AFAIK, that's already true for >= 68020.

> and jumps to the address in the corresponding exception vector
> (first 256 longs in RAM).
Not necessarily. On 68030 (maybe already 68020), there's the vector base
register (VBR). So, in fact, the address the CPU jumps to is VBR + 4 *
vector_no.

Ciao

Thomas

I've made a title screen in DEGAS and want to load it into memory. Once in memory I want to display the picture on the screen very small(Like its far away) and then zoom in on it(Getting bigger until it fills the screen). As the picture is being zoomed in on I want to rotate it, spin it e.t.c. How is this done? Can I use the GET/PUT commands and how about using the screen flipping thing draw to logic and then copy to the physical screen. How is that done?

Any help would be greatly appreciated.

As well anyone know where I can download some good examples(source code) for GFA BASIC.

E-Mail: e63sah@morgan.ucs.mun.ca.

In order to achieve what you want to do, you'll need to write a Degas loader
routine, this has been documented many times, and really isn't a difficult
concept when you have the info on how the file is structured, and how
the ST handles colour. To get a blow by blow of the Degas formats get
a hold of the text file called PIXFMT.TXT it's one of the best descriptions
of Atari graphics formats.

If you use the GET/PUT commands you risk your program not working on other
machines because the GET/PUT make Line-A calls (or at least this is what
I've read). Better to use the VDI blit routines vro_cpyfm(). If you don't
care about Line-A calls then GET/PUT, or BITBLT which is faster than
PUT/GET, are fine. There's also something called RC_COPY, but that seems to
be related to window handling.

Finally you'll need some sorts of image processing algorithms. One for
rotation and one for resizing an image. I suggest the library for finding
this information. Back issues of Byte had lots of interesting technical
info on image processing. Of course using a screen buffer (screen flipping)
is a good idea to fool the viewer's eye into seeing a seamless animation.

Animation brings up another good point. If you have a program like Cyber
Paint, you could do the whole intro as a SEQuence animation, and simply load
that file and play it. GFA would simply do the load and play back, and
you wouldn't have had to muck about with raster image transforms.

Later...

The vector base register in fact exists in a 68010 already !!

Why not take a look at the CBHD archive?

As well as the driver, configurer etc. this contains a s/w SCSI interface
which can be loaded at run time together with a description of how to write
code for this i/f.

Fast? No! flexible? well...
There is another VDI call, v_pmarker, which can be set to plot single
pixels. As with v_pline you give it an array of coordinates and it will
plot pixels at each coordinate.

The method of building a bitmap and use VDI calls to put it on screen
might be faster if you have a lot of pixels to set.

Greetings,

Tomas

5282. GNU and shell problem?

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-26 00:00:00 UTC
From: Vince <ihavenomail@hoi.nl>
Message-ID: <338A0BDC.AB7@hoi.nl>
Source record: 6833

Hello everyone,

I tried to install the newest GNU binaries (is that 2.5.8?) on my Falcon
and suddenly I had all sorts of problems with files that could not be
found. It appears to be a communication problem between Gulam and GNU,
i.e. somehow the new GNU works with unix style '/' instead of dos style
'\'.

Anyone to confirm this??
Anyone know a unix-like shell or other sollution to this problem?
Couldn't set myself to install Linux yet.

greetz,
Vince

5283. Where to store settings files?

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-26 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <8UXMCYI@tos.pl.net>
Source record: 6834

With the apparent progress towards GEM being more multi-user friendly, much software stores its settings in the user's home directory. This is, of course, an excellent thing, but there are still some irregularities.

For example, some software stores the settings files in a directory called "defaults" in the users home directory, while other software stores the settings file directly in the home directory.

Also, since the concept of storing the settings in a home directory seems to be derived from UNIX, should be also derive the file naming convention from UNIX; i.e. the settings for an app called "test" would be stored in a file called ".testrc"? Or should we name the files more like "test.rc" or "test.set"? The trouble with the latter approach is that a user's home directory soon gets very cluttered with settings files, whereas under the UNIX convention, these files would be hidden (since the name begins with a '.' character). However, the UNIX naming is not very useful under a MS-DOS style filesystem, where a filename such as ".testrc" would be truncated to ".TES".

Also, since many GEM users do not have a multiuser system, it is quite likely that the user may not have any home directory. Where should the settings files be put in this case?

I posted about this some time ago but received no responses. I believe it is important, however, that a standard system for placing and naming settings files must be constructed in order to avoid the difficult problem of a variety of systems being used.

I would be interested to hear any comments anyone may have on the above.

Check out Steffen Engel's SCSI library which comes as part of the CBHD
driver package. You can download it from any good Atari ftp site; here
are just two links:

http://www.funet.fi/pub/atari/diskutil/cbhd502.tos
ftp://ftp.uni-paderborn.de/pub/atari/tools/hd/cbhd502.tos

If you are working with only one color (at a time), you can use
vrt_cpyfm() and only have to deal with one simple (mono) raster
image.

5290. Scaling GDOS fonts?

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-27 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <5mfjjh$rgb@alexander.INS.CWRU.Edu>
Source record: 6841

Is there anyone out there to advise me how one makes
double size fonts from GDOS fonts (bitmapped). For my TelVYT102 I need
to be able to scale fonts to be
1) double width
2) double height,
and if possible
3) top and/or bottom halves of double size fonts.

Can anyone help?

Boris

Mario Becroft (mb@tos.pl.net) wrote:
: Also, since the concept of storing the settings in a home directory seems
: to be derived from UNIX, should be also derive the file naming convention
: from UNIX; i.e. the settings for an app called "test" would be stored in a
: file called ".testrc"? Or should we name the files more like "test.rc" or
: "test.set"? The trouble with the latter approach is that a user's home
: directory soon gets very cluttered with settings files, whereas under the
: UNIX convention, these files would be hidden (since the name begins with a
: '.' character). However, the UNIX naming is not very useful under a MS-DOS
: style filesystem, where a filename such as ".testrc" would be truncated to
: ".TES".

Tell me about it... Under MiNTOS, the version of 'tcsh' I use insists on
having 'tcsh.rc' files and refuses to recognise '.tcshrc' files (I'm abviously
using the Minix filesystem).

: Also, since many GEM users do not have a multiuser system, it is quite
: likely that the user may not have any home directory. Where should the
: settings files be put in this case?

I'm not sure that this is really a problem: if there are no users on the
system then you may only use the system with 'root' permissions. In these
cases the configuration files usually reside in an 'etc' directory (either
/etc or in /local/etc). Config files found here are generally read first by
most UNIX apps (others provise facilities to include standard config files
in the user's own).

: I posted about this some time ago but received no responses. I believe it
: is important, however, that a standard system for placing and naming
: settings files must be constructed in order to avoid the difficult problem
: of a variety of systems being used.

I have been giving issues such as these some thought. Basically, I believe
that UNIX has got config files right: stick standard ones in '/etc' and
'/local/etc' and the user has their own in their $HOME directory.

This works even if their is only one user on the system (you only have the
config files in /etc and /local/etc) and can be made to work with M$-DOS
filesystems by making the apps looking for config files look for '.testrc'
first, then 'test.rc'.

Well, you asked for comments!

Cheers,

James Cox.

Usually test.inf or test.dat (but almost any extension will do). Nor is the
practice peculiar to or derived from UNIX.

m > Also, since many GEM users do not have a multiuser system, it
m > is quite likely that the user may not have any home directory.
m > Where should the settings files be put in this case?

Same directory as the application.

well, I've got something like this...
there is only 2 minor trouble:

-It is a .TAR file (You can manage to read it with a good text
editor,even if it doesn't look very pretty)

-It's over 1.5 Mbyte! Even packed with ZIP, it is not far from 300 Kb...

If you're interested, Email me!

5301. Re: Where to store settings files?

From: mb@tos.pl.net
Message-ID: <C31MCAE@tos.pl.net>
Source record: 6902

So, having read the article by James Cox, which seems quite sensible to me, reading the configuration file would go something like this:

Try ~/.appnamerc
Try ~/appname.rc
Try /etc/.appnamerc
Try /etc/appname.rc
Lastly, try appname.rc in the current directory (where the app was started from). This is necessary for people who don't have a UNIX style directory tree.

But, where should the settings be saved to? Perhaps they could be saved to the same place they were loaded from, but what about when there were none to load?

Also, what happens to the ~/defaults directory, where some apps store the settings?

I suppose you could simply change the size with vst_point() or
vst_height(). To get the halves, you could use vs_clip() to clip the
drawing to one half of the font, perhaps.

Why not use the VDI call for setting a font's height, i.e. vst_height() ?
Better still, use vst_point() !

Cheers Peter

erm, offhand, I don't recall a command for this - you'll need to have
a double width font.

>>2) double height,

vst_point or vst_height.

>>and if possible
>>3) top and/or bottom halves of double size fonts.

btw, bitmapped fonts can only be scaled to a maximum of twice their
original height.

5306. Hard Drive controller?

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-30 00:00:00 UTC
From: !ynoT
Message-ID: <33b4e796.25485126@news.airtime.co.uk>
Source record: 6907

My current project is to use as much memory as I can on a bare bones 4meg STe or Falcon,

The only thing not to be turned off (trying to insist on a clean boot) is the hard drive control fing,

Currently the game is taking 2.7 meg.. but more animation to come,

QUESTION, How much memory do I need to leave free for the HD controller?, is it minimal as in a few K, or is it like quarter to half a meg or something ?

I do not have a HD so testing for the result is impossible :)

The game has been succesfully tested and breezes through everything up to and including a Falcon with Nemesis, but a clean system is prefered, I presume the HD controller is the minimum, nothing else desperatly needed to boot the old Falc is there...sorry I havent got one of them either :)

Cheers !ynoT (ATARI Programmer)

That's fine.

> QUESTION, How much memory do I need to leave free for the HD
>controller?, is it minimal as in a few K, or is it like quarter to
>half a meg or something ?

Difficult to say specifically. It depends on how the driver is set up.
If memory serves, I can get round about 3.5 meg although I can't
remember if that's with or withoot Zcontrol, probably without. As a
rough guess, I'd assume 3.2Mb.

> I do not have a HD so testing for the result is impossible :)

Mine refused to boot today - got me rather worried until I spotted the
hd end of the dma cable had unplugged itself and was lying on the
floor. Must have forgot to screw it up when I moved the computer! ;-)

> The game has been succesfully tested and breezes through everything
>up to and including a Falcon with Nemesis, but a clean system is
>prefered, I presume the HD controller is the minimum, nothing else

>one of them either :)

Well, nobody would want to mess with their driver settings so I guess
the best thing to do is just see what the highest setting is for a 4mb
machine - who cares if a driver takes 1Mb on a 14Mb Falcon eh? <G>

Does anyone know where I can find some info on the object file format
the atari version of GCC uses? What format does it use anyway?
And why do all my messages keep appearing twice in one msg? :-)
Questions, questions, questions...

5311. atari 800 looking for good home

Newsgroup: comp.sys.atari.programmer
Date: 1997-05-31 00:00:00 UTC
From: "Scott C. Parker" <scp@techie.com>
Message-ID: <33906972.9A2FA2CF@techie.com>
Source record: 6912

I have an atari 800. It's been in a milk crate for several years and I need the closet space. I'd hate to leave it on the curb. So, if anyone can give it a good home. Please let me know. I live in Greenwich Village, New York City. I don't want to have to pack and ship it, so if you're interested, you would have to pick it up.

Not to my knowledge. Their might be some NVDI call or something but if
there is I've never come across it.

Assuming there is no call, perhaps Connect is getting round the
problem by generating double widths on the fly. I'm guessing here but
it might print offscreen, call some code to double the width, then
blit the result back to the screen. Alternatively, it might fiddle
with the font header and/or table and fool gdos. Perhaps it prints to
a virtual screen half the width then blits it back somehow? - I really
dont know.

If somebody has a solution please enlighten us!!

5316. SAM SAA files, automatic installation of

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-03 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <ZV7MCTE@tos.pl.net>
Source record: 6917

I have recently obtained KP SACK (SAA Construction Kit) in order to add SAM support to my applications.

It appears that for the application to make use of SAM, the _user_ must install the SAA file.

It would be better if the installation program could do this. In fact, ideally the user should not have to do anything at all to install a program, except run the installation program.

How can this be accomplished, with regard to SAM and SAA files? Is there some method of installing these files in a manner such that user interaction is not required? Naturally the user will have to assign the actual sounds, but the user should not have to worry about installing the SAA file.

5317. desk icons, doc association etc, automatic installation of

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-03 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <LW7MCWG@tos.pl.net>
Source record: 6918

If you read my previous post regarding SAM SAA files, you will notice that I was looking for a way to let an installation program automatically install the SAA files.

The same applies to various other items: an installation program should be able to automatically install desktop icons, automatically assign those icons to a file and also automatically associate document types with the application(s) being installed. Also, sometimes automatic installation of fonts would be desirable.

According to the style guide in the Atari Compendium, this should be done by directly changing the relevant files: newdesk.inf, desk[c]icon.rsc, assign.sys, extend.sys etc.

As you can see, however, the above method is far from satisfactory. In particular, I can see the following problems with the above system:

* The method for locating these files is undefined.

* Letting any application change these files could be dangerous.

* Some of the files, for example the desktop icon resource files, are rather difficult to modify from a programmer's point of view.

* But most importantly:
The TOS platform suffers from not having enough standards, and this is apparent here - when people use alternative desktops (e.g. Thing, Gemini, Neodesk, Ease...) and GDOSs (e.g. NVDI) that use different setup files to the standard ones, the above method will fail.

So, what is the correct method for installing items such as those listed above? It seems that there is no proper way, and if this is true, it is important that a standard method be put in place. Support for this method could then be added to desktops, GDOSs and other relevant software, and maybe we would finally be able to have user friendly installation software.

Briefly, I would suggest that such a method would include at least the following facilities:

* Facility for an application to add fonts to the system.

* Facility for an application to add icons images to the system.

* Facility for an application to assign icons to files.

* Facility for an application to assign certain file masks to an application, so that when the user double clicks on files that fit the

mask, that application is started.

* The above facilities would have to be flexible enough that they could be supported by a wide variety of desktops, GDOSs or other system software.

* They should operate automatically, without the user having to carry out any of the tasks. Some user interaction may be advisable in places.

I would be interested to hear other peoples' views on the above matters.

This sounds quite interesting, though personally, I dislike having too many
things done automatically - there's always some risk with it, especially if
you are running your very own setup (e.g., under MS-DOS, my autoexec.bat
always gets corrupted by programs which try to install themselves in it, as
I'm using a multi-setup-autoexec).

Dispite my personal opinion, the above things could maybe be done with
either an accessory, providing support for the user's setup (desktop, GDOS,
etc.), or a system tool, which does the same. The system tool would have
the advantage that it could be made modular, so the user just has to choose
the module(s) neccessary for his setup. An environment variable could point
to the full path of the tool, and another to the module directory (if
desired).

The tool would be called with special command line parameters, telling it
what's to be done (an accessory would receive AES messages for this). The
exit code would signal success or failure of the procedure.

Is that what you are thinking of?

Ciao

Thomas

From: willard@headwaters.com
Message-ID: <5n1jmb$9rg$1@news>
Source record: 6920

Greetings all!

I've put a mailto form in my webpage that generates an email to me.

I've done it this way because my server doesn't want to expend processor time on me processing the usual formto file.

He says I have to write a small program to strip out the garbage characters and put in carriage returns.

Is there such a little program out there? Anyone willing to write one for me in, say GFA Basic and provide me with source? I can email a sample message generated by the form if anyone is interested.

Thanks for the help!

Here is the short and SLOW source code for GFA-basic how to do that zoom and rotate effect with code.. I hope someone has help with it..

It does not have double screen buffer, because I can't remember the registers etc. it needs and I don't guarantee that it works correctly straight from this code.. But there it is anyway..

: Is that what you are thinking of?

Exactly. I wasn't sure exactly how it would be implemented, but that is
the idea.

I would suggest that the desk accessory would be less desirable since it would just use up RAM, while most of the time it would lie unused. An option where the program would be loaded only when used would be preferable.

A possibility might be that the "installer" (I can't think of a better name just now) would be programmable with some sort of script language. The script would describe how to install various elements, and scripts would be supplied with software such as desktops, AESs, GDOSs, SAM and compatibles, etc.

The script might support features such as:

* modify a file in some way

* send an AES message to a running application

* permanently set an environment variable

* possibly some other similar methods

* ways of checking information before performing the above methods, such as the ability to act on the contents of a file, environment variable or other data would be provided

* possibly other relevant features

Such scripts could be installed to handle installation of any item, and all scripts capable of installing a similar item would have the same interface. This would mean that installation software supplied with applications would not have to worry about what method is in use, it could just use one standard method, and the script(s) would convert the request to system specific operations.

Naturally, the "installer" itself would come with installation software that is as universal as possible, so that installation of the "installer" itself would be easy to install. Also, software that needs to supply new scripts would be able to automatically install such scripts using a standard "install script" feature of the "installer."

So, the functions provided to installation software by the installer might include:

* "Install item"
Parameters would include:
+ type of item to install (possibly a cookie?)
+ path to item(s) being installed OR the actual data to be installed
+ how to install them (can't quite think how this would be used at present)
+ some type specific parameters

* "Uninstall item"
Parameters could be similar to "install item". It could be argued that this function would be best left out, but provided uninstallation software that uses it properly (i.e. the choice of what to do is ALWAYS up to the

user, although a sensible default is provided) it should not be a problem.

* "Add or modify script"
This would allow a new script to be installed. Problems could occur if two scripts became available for installing the same type of item. I guess the new script would take precedence over the old script, but the old script would not be deleted. This way, if the user later un-installs the software that installed the new script, the old script could be reverted to.

Data types supported would be expandible, but in order to maintain compatibility and consistency, not just anyone could add a new data type.

Possible data types could include:

* fonts
* desktop icons
* icon-file associations
* file-application associations
* dlls, once they are supported (several such extensions to support dlls are in developmend)
* sounds, SAM SAA files, and SAM event-sound associations
* probably others.

Standard scripts could be made to support common programs, and hopefully programmers would catch on and start supplying the necessary scripts with their software.

It is important that an open, expandable standard for all of the above be developed, otherwise we will only be creating more non-standardness.

If enough people are interested, maybe we should set up a mailing list for discussion of the idea.

5326. Mailloop: Mass Mailer and Newsgroup Poster

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-05 00:00:00 UTC
From: adosfjdslk@ao
Message-ID: <5n74cs$v@newsfep3.sprintmail.com>
Source record: 6927

Mailloop v3.0 is an industrial strength bulk mailer.

Mailloop v3.0 is a bulk mailing program for the internet. It can take a single message and broadcast it to either a listing of e-mail addresses or to a listing of newsgroups. Creates custom newsgroup lists by filtering NNTP servers. Creates custom e-mail lists by extracting them from newsgroups. Can also extract e-mail addresses or newsgroup names from other protocols. Built-in NNTP, SMTP, POP, FTP, HTTP, EXEC, CGI, WHOIS and FINGER clients. Anti-cancelbot feature. Automatically processes remove requests. Includes extensive on-line help.
The most powerful bulk mailer available. Requires Windows 95 or NT 3.51+ and internet access.

The "Program" Mailloop is only available in English.

For more info goto: http://205.199.4.219

http://205.199.4.219

Using it is easy:

1) Create a message (http://205.199.4.219/editor.htm)
...by using the pull down menus or
...by using any editor

2) Create a newsgroups list (http://205.199.4.219/news3.htm)
...by filtering an NNTP server or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from any FTP file or
...by extracting from any HTTP file

3) Create an e-mail list (http://205.199.4.219/em3.htm)
...by extracting from newsgroups or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from a WHOIS response or
...by extracting from a fingering response or
...by extracting from a UNIX response or
...by extracting from any FTP file or
...by extracting from any HTTP file or

4) Broadcast the message
...to the e-mail list or (http://205.199.4.219/embc.htm)
...to the newsgroup list (http://205.199.4.219/ngbc.htm)

5) Then process the remove requests
...by using the mailbox processor (http://205.199.4.219/pop.htm)

6) If you want you can use the Newsletter Sever
...The Newsletter Sever will allow you to have an topic-specific newsletter that other can subscribe
and unsubscribe to.
...Customizing this server response files (http://205.199.4.219/response.htm)
...Creating a new newsletter (http://205.199.4.219/create.htm)
...Creating and Updating a newsletter the actual newsletter (http://205.199.4.219/update.htm)

Hi All,

I do not want to succumb to the hype generated by Java, but is there anybody trying to port the Java Virtual Machine on Atari Computers?

I believe the specification for network computer are high, in terms of memory, display and CPU, but the Falcon, and TT could be capable enough (Hades and Medusa for sure). It could be well worth it as such project could prolonge the life of our favourite machines.

What do you think?

Bruno

Start it, if you have the time. May be you could do a JIT Compiler...

Information about the virtual machine should be found at

http://www.javasoft.com/

For the interpreting the Java Bytecode bison should be the right tool.
just go ahead.

Christof

5330. checking for either left or right mouse button

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-07 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <73361181_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 6931

I thought I'd put BubbleGem support into some of my programs and have hit
the following problem:

How do I check for either the left or right mouse button.
I have a main loop which uses evnt_multi (so I can process other events
too). Part of the event_multi uses evnt_button stuff, but evnt_button seems
to be a bit flawed. It seems there is no way to get it to return if *either*
button is pressed. Just both (which is no use at all).

One way is to check on an evnt_timer using graf_mkstate but this seems very
wasteful of processor time.

Is there a better way of doing this?

TIA, Gary

Hi, Gary
I checked my Lattice C manual.
You should pass a variable with the following bits set:

check for right mouse button: 1
check for right mouse button: 2
check for 'ALT' button: 4
check for 'CONTROL' button: 8

'OR' the values together that correspond to the event you're interesed of.

I've scanned mouse events with luck.
It should work.

Good luck!

5333. Win95 OSR 2.1 CD $35 W/Fat32, Fat converter, Full install

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-07 00:00:00 UTC
From: jasonben@aol.com
Message-ID: <5nc8u4$d7n$907@usenet85.supernews.com>
Source record: 6934

Win '95 OSR-2.1 on CD with Fat32 Boot Floppy, FAT to FAT32
converter; $35 + 4.50 for Postage/COD, or offer.

Full install version. USB Support. This CD also contains
the Microsoft FAT to Fat32 converter.

Are you tired of losing up to 40% of your disk capacity
to the huge cluster size of FAT16, P-n-Pray that does
not work, poor pcmcia support, misidentified motherboard
resources, CPUs, ect?

Well, moving to the OSR 2.1 version of Windows '95 is the
answer.

Win '95 OSR2 also contains important patches, an expanded
(and debuged) drver library, PnP that works, GUI improvements
and bug fixes.

Yes - Some, not all, of these are available for as downloads.
Yet - The most important parts: *FAT 32*, the Kernel and GUI
enhancements, PnP improvements and proper CPU identifier codes
are NOT available for download and currently can only be
obtained with the purchase of a new computer or "memphis"
(Win'97), whenever that will be available.

The CD is the full install version. Included is a OEM cd-key,
an OSR2 boot floppy for creating a new FAT32 partition, MS CVT.EXE
for converting a FAT partition to FAT 32 detailed installation
instructions. In addition to these instructions, there is full
documentation on the CD. There is no "paper manual." Except
detailed installation information. Your current Win '95 manuals
will still apply, with a few *highly documented* exceptions.

The primary reason for migrating to OSR2 is, of course, FAT32,
which increases the storage capacity of your drive simply
by keeping the cluster size at 4K, despite the size of your
hard drive. It also recognizes partitions larger than 2.1g,
the current Win '95 limit.

I was hoping to get $ 35 for the CD, Boot Disk and instructions,
+ 4.95 for USPS COD. I am, however, open to reasonable offers.
I will pay shipping on pre-paid orders.
E-mail for more information.
Jason

This isn't what Gary was thinking of, as I understand it.

To check for either button is unfortunetely an undocumented feature, but
what you need to do is OR the mouse wait value with 0x100, that's
hexadecimal. To check if either is pressed, use the value 0x103.

Greetings,

Tomas

> > number (8 bytes total).
> AFAIK, that's already true for >= 68020.

The "Format Word" debuted with the 68010.

So, at the start of the trap handler, the supervisor stack looks like this:

ssp+0: SR (2 byte word)
ssp+2: Return address (4 byte longword)
ssp+6: Format word (2 byte word)

If you are running on a 68000 or 68008, then the format word does not exist.

However, if you are using a 68010+, _DO_NOT_ alter the format word. You
will get a "Foarmat error" with 14 bombs.

> > and jumps to the address in the corresponding exception vector

> Not necessarily. On 68030 (maybe already 68020), there's the vector base
> register (VBR). So, in fact, the address the CPU jumps to is VBR + 4 *
> vector_no.

The VBR also arrived with the 68010. This allows the exception table to
appear anywhere in memory - not just the first 256 bytes

_longframe = $59e. (1438 decimal)

This is a word (16-bit) value.

If it is zero, then the stack frame is 6 bytes long, otherwise eight bytes.

The "Format Word" debuted with the 68010, lengthning the 68000/68008
stack frame from six bytes to eight.

DO NOT alter this word, as you will get a "Format Error" exception (14
bombs under TOS) at the next RTE

> > and jumps to the address in the corresponding exception vector
> > (first 256 longs in RAM).
> Not necessarily. On 68030 (maybe already 68020), there's the vector base
> register (VBR). So, in fact, the address the CPU jumps to is VBR + 4 *
> vector_no.

The VBR also debuted on the 68010 - allowing the exception table to
appear anywhere in physical memory, not just the first 1024 bytes.

5341. Component Manager -- good place to upload?

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-08 00:00:00 UTC
From: jamesco@cogs.susx.ac.uk
Message-ID: <5nfc0m$a0b@infa.central.susx.ac.uk>
Source record: 6850

Well, after three years and a fair few promises of an early release, my component manager is finally ready (funny how this coincides with my end of my degree :).

I have the package sitting on my hard-drive at the moment in the form of a tar-ed, gzip-ed archive but I don't know which FTP site to upload to! I want to get this out and available as soon as possible since I don't have all that much time left at University (I have until the 27th of June).

There are a few people who I am going to email about putting it on their FTP sites, but I would welcome any suggestions for where to distribute it from.

I suppose I should tell you what is so good about the component manager then...

The thing was born out of the fact that MiNT has no support for shared libraries, and I didn't like the fact that quite a few programs share the same basic source code for certain functions (at a mundane level, string handling for example). So I started work on building a program that would load and unload standards bits of program code that provided system wide libraries of functions.

This turned into something which, in my opinion, should be a part of the operating system. At this point I should mention Sven Karlson's (sp?) project to create an entirely new operating system for the Atari: Fenix. The kernel is very small with Fenix, and all of the device drivers, filesystem drivers, etc.. are implemented as 'servers'. These servers are loaded as needed and help make the overall size of the kernel _very_ small.

The component manager that I have constructed is built with this in mind: most components are 'non-resident', that is, thay may be unloded from memory if no client wishes to use it (some components would have to be 'resident' since they might patch into an interupt vector, for example).

The component manager provides a simple interface between clients and the components that is very 'open'. Components can have whatever protocol they wish for providing their function(s). It is upto the documentation about how to use that 'class' of component to detail how to interpret the protocol.

Anyways, enough of the boring details... The component manager is a tiny archive: the actual program is only 5700 bytes of so on disc, although uses about 40K of memory (with memory protection turned on). My next concern is finding someone who will distribute the system around. If anyone would like to volenteer some FTP space for it, it would be most appreciated.

Sven: if you read this, get in touch with me if you want more technical info on how my component system works: I'm not releaseing source codes for my first

version of this (whilst it is stable, it is not really complete yet).

Cheers,

James Cox.

b >
```

Depends whether there are enough Atarians out there who want to take advantage of network applications using JAVA.

My opinion on NC's is mixed, right now there's a lot of talk, promised product, demo machines, and assurances of actual consumer demand, which sounds a hec of a lot like Atari's ol' tricks. :-) I think a lot of people who could afford personal computers went out and bought those, and aren't likely to fork over more cash to buy a consumer electronic product that allows them to only link to the internet.

Also Bill Gates is putting pressure on the industry to stay away from NC's, and is also pushing VB Script and ActiveX. I guess this just encourages the split between C++ and Visual BASIC developers (only now on the network).

The Falcon and TT could likely handle it, but how many people who own Atari computers own these particular ones? I doubt most Atarians will rush out to buy a Hades just to use JAVA.

Still it does sound like an interesting development project. Maybe you should contact Sun Microsystems with a proposal to deliver a JVM for the Atari line. The fact that Sun has a distaste for Microsoft might get them interested. Anything to spread the popularity of JAVA vs. ActiveX could be seen as a positive.

Later...

PHOTO PHOENIX INTERNATIONAL

We are an international New York based agency representing
amateur and professional photographers in the following areas: Galleries,
Business and Organizations, Book Publishers, Paper Products, Consumer
Publication, Newspapers & Newsletters Publication, Special Interest Publication,
and Trade Publication.
We are seeking photographers who strive for excellence in the aesthetic/
creative and technological world of images, who have the talent to capture
the setting and to convey the mood. Your work should reflect a genuine,
pervasive interest in photography as a fine art.
Whether your work portrays conservative, experimental, stylish, or innovative
themes, your project proposal should be well thought out before submitting to
us.
For first contact, please submit a query letter, direct mail flier/brochure,
tearsheets, slides, photographs & SASE.
For amateur photographers, send sample photos and/or slides.
TO ALL: Do not send entire portfolio unless we ask for it. If we are not interested,
you might not hear from us, so please submit material that does not need to be
returned.

Send to:
Photo Phoenix International

Its a big suprise, quite a bit of rethinking to do :), I seriously
thought just a few thousand bytes for some sort of HD driver... well I
have to keep on the safe side so will make it a maximum 3.5meg,
And thanks there mate... suprisingly none responsive audience for
this one.. perhaps the question was far too difficult ;--))

Gary Priest (gary@the-gap.demon.co.uk) wrote:
: I thought I'd put BubbleGem support into some of my programs and have hit
: the following problem:

: How do I check for either the left or right mouse button.
: I have a main loop which uses evnt_multi (so I can process other events
: too). Part of the event_multi uses evnt_button stuff, but evnt_button seems
: to be a bit flawed. It seems there is no way to get it to return if *either*
: button is pressed. Just both (which is no use at all).

: One way is to check on an evnt_timer using graf_mkstate but this seems very
: wasteful of processor time.

: Is there a better way of doing this?

Certainly there is. Unfortunately, the method for doing so is frequently
mis-documented or not documented at all. Nevertheless, I believe the
following is correct:

The first two parameters of evnt_button (and the corresponding ones of
evnt_multi) I will call clicks and mask respectively, as they are called
in the Atari Compendium.

mask should be set to 0x03 (both left and right buttons) and to specify
waiting for one OR the other you must OR 0x100 with clicks.

So, to wait for a single or double click of the left or right mouse
button for example, clicks would equal 0x102 (0x02 | 0x100) and mask would
be 0x03.

Note that this method only works as of TOS 1.02.

: If memory serves, I can get round about 3.5 meg although I can't
: remember if that's with or withoot Zcontrol, probably without. As a
: rough guess, I'd assume 3.2Mb.

Actually, you should have substantially more than that unless the user has
large caches. I would have suggested 3.5MB or more.

The best way to do it would be to load more sounds, animations or other
data if memory permits, otherwise just load data when it is required.

Yeagh but one way of looking at that is the HD user gets a more
crippled copy than a floppy user.. of course you could say HD game...
but Floppy users get extra :)

One of the targets is to make a game that works exactly the same on
all machine, from a 4megSte floppy system to a 14meg Falcon with HD,

Making it work differently for different versions means I dont get to
see whats happening, when someone writes to me about the software, I
like to be able to see exactly what they can see,IYKWIM :)

I think dropping my original 4meg target to 3.5meg wills ee me
through <Smile>

This is probably true. Here, it's the user definable stuff like the
various types of cache and their sizes which is the unknown quantity.

>well I
>have to keep on the safe side so will make it a maximum 3.5meg,

I'll assume most of this space is for graphics - what about having
some of the disk files compressed and expanding them immediately
after loading, or does STOS do this anyway?

> And thanks there mate... suprisingly none responsive audience for
>this one.. perhaps the question was far too difficult ;--))

hehe! methinks it's more a case of too much trouble to disable
everything! ;-)

There is another solution (albeit less elegant): set the mask and
state both to 0, in which case it will return on ANY button event.

Hi,

Can someone give me an advice how to handle long file names like the ones used by MagiC and MiNT. Right now I'm reading the path and filename from the basepage (the parameter/command line) but it doesn't work very well when long file names are used.

Thanks,
Daniel Hedberg

It isn't undocumented. It has been for a long time, but Atari decided to
document it and AFAIK it's also mentioned in the Compendium.

Ciao

Thomas

Hi!

In article <33d_9706111232@conchbbs.com>,
John.Kormylo@7861.conchbbs.com (John Kormylo) writes:
> There is another solution (albeit less elegant): set the mask and
> state both to 0, in which case it will return on ANY button event.
No, it will always return from the evnt_multi()-loop immediately, with 0
as the pressed button mask if no button has really been pressed. This
will awfully slow the application down (and even worse, it will slow down
all other applications in a multitasking environment as well), so I really
recommend not to use this method.

Ciao

Thomas

P.S.: The above holds true for TOS 1.02, but I wouldn't bet all AES
react the same with this (now really undocumented feature), so
it might be that for example N.AES returns no button events at all,
MagiC behaves like TOS 1.02 (i.e. "endless" events), and MTOS only
reacts on real button events.

It sounds like you want to extract a long filename which has been passed
as arguments to your app.

The method for doing so is no different to usual - the method for
obtaining the commandline is not affected by what data is in the
commandline.

However, to make proper use of long filenames, you will need to ensure
that you are running in the MiNT domain with Pdomain(DOMAIN_MINT). This
tells the OS that your app understands things like long filenames.

You will also find that you cannot use the Fsfirst() and Fsnext()
functions for getting a directory list, since these only support MS-DOS
style 8+3 filenames. Instead, you need to use Dreaddir() and related
functions.

Apart from this, I don't think there should not be much that needs to be
handled differently. Just remember that everything is case sensitive and
that you need to allow room for the long names.

There is one other thing to think of, though, and that is quoted
filenames. With filesystems like the Minix filesystem, which allow spaces
in filenames, quoting of filenames must be used where filenames contain
spaces. Otherwise, there would be no way of distinguishing one filename
from the next in a space separated list. Therefore it would be advisable
to support filename quoting in your app. This may be useful when receiving
filenames on the commandline or perhaps from a fileselector, AV protocol
message or other source.

The quoting is quite simple, and works as follows:

* Filenames are surrounded by the apostrophe character `''.

* Where there is an apostrophe character `'' in the filename, two such
characters are inserted in its place.

So for example, the filename:

This isn't a good example of a sensible filename

when quoted would read:

'This isn''t a good example of a sensible filename'

I hope that was of some help.

```
d > Right now I'm reading the path and filename from the basepage
d > (the parameter/command line) but it doesn't work very well
d > when long file names are used.

The first question is, what is writing the command line?

If the desktop is doing it (e.g., dropping a file on the application
icon), then you don't have much control.

If you are writing TTP programs, stop doing that! Think of command
lines as a bad programming practice, maintained for backward
compatiblity. Call fsel_input() to get any file names.

If you are writing parent/child programs, there are many ways to
pass info between processes. My favorite is to replace the
environment string pointer in the basepage with a structure pointer.
My least favorite is to pass the info with an environment variable.

OK, I know it's not very wise to use it, but how does a (X)IMG file
look like for screens which use packed pixels (ie. >256 colors)?
Come to think of it... How does a standard bitmap look for such a mode?
Is a 16 bit color mode bitmap line, for instance, seperated into 16
lines of one plane each? (That would be logical...and horrible!)
And what about overlay bits?

I have got 3293524 bytes at a 'normal' boot and 3785514 bytes at an everything free boot. I you want to have maximum free memory with harddisk drivers enabled use a RAM bootsector and take over full control after the harddisk is booted. (The RAM bootsector is executed after the harddisk has booted but before the autofolder is executed.) I am still wondering why Falcon demo crews don't use this trick to get maximum free and clean (no NVDI and so on) memory on the Falcon.

I think 3.5 Mb is a workable amount, still leaves some place for things that make life on a harddisk system easier.

Bye, Hans Wessels

5370. Distributors Wanted NOW!!

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-14 00:00:00 UTC
From: Tony Scott <summer@laoffices.com>
Message-ID: <5nubtk$84p$7524@cadmium.aware.nl>
Source record: 6871

Hi,

This is a Solicitation Email, we are looking for new TUFF'97 DISTRIBUTORS.
TUFF'97 is a promotional concept for a prospect follow-up system called
"Simple Track". Software designed for Windows 95, 3.11 and NT
machines. (Macintosh users read the NOTE below(*))

Concept:

The TUFF'97 software includes a copy of Simple Track, so you can use this
for your own personal administration (free). However, the TUFF'97 software
is designed to give you BIG TIME credits for just taking the efforts to
PROMOTE it.

How do I get those credits?. Easy, just distribute/promote it. How?
(Give away the software for free, put it on your website/homepage
and let everyone download it. Give it to your friends, attach it by
email etc). With a one time $40.00 (USD) validation code purchase,
YOUR name becomes part of all sofware you sent out to your customers.
When your TUFF'97 software gets validated, all your personal information is
automatically integrated in the software, so everyone knows how to reach
you by phone/fax or email and where to sent the check/money or cash orders.

Basically this is the concept. Offcourse you need the software to grasp
the whole thing. Believe it, there is absolutely no marketing knowledge
required, just ask for the software package, join and start promoting your
own TUFF'97 line. The only thing you DO need is a PC or Mac(*) and Internet.

(*) TUFF'97 is only available for MacOS users running Connectix VirtualPC
or Insignia's Sofwindows 95/3.11. A true MacOS version is not available.

When you're interested in becoming a TUFF'97 distributor and create your own
distribution line, sent a mailto:FiReStArTeR@frodo.com and ask for your
copy of the TUFF software (We'll sent you a download location and install
instructions). This is a serious opportunity, so only serious responses
are processed. If you're not interested, have a nice day.
Best Regards,
Tony Scott

schwab@issan.informatik.uni-dortmund.de (Andreas Schwab) writes:
> Use Fxstat().
That's Fxattr() :)

The best way for all this (in C) would be to use the MiNT-lib (the
version with most MiNT-cookie-checks removed) and its
UNIX/POSIX-conforming calls. For example, To check for a file's length,
one would use stat() or lstat(), which will always use the best function
call available (i.e. Fsfirst() with plain TOS, Fxattr() with MiNT/MagiC
and alikes).

It's not bmask you have to add 0x100 to, but the number of clicks. Also,
you have to wait for the release of mouse buttons, the 0x100 "inverts"
the meaing of bstate, i.e. "wait for left or right mouse button NOT being
released -> pressed". E.g., to wait for clicks and double clicks of
either the left or right mouse button, use 0x102, 3, 0 as parameters for
evnt_button() or evnt_multi().

That's the trick.

Ciao

You could take a look at the sources of my color icon routines, which
make extensive use of all the three. Though I haven't uploaded the
archive of the latest version yet ...

Some short information about the calls:

vro_cpyfm(): VDI raster copy, opaque
Allows you to copy rasters (rectangular areas described by MFDBs, memory
form definition blocks) in device-dependent format from screen to screen,
screen to memory, memory to screen or memory to memory. There are quite a
lot of copy modes possible (invert, or, and, etc.)

vrt_cpyfm(): VDI raster copy, transparent
Allows you to copy one-plane rasters from memory to screen or memory,
selecting between four modes (replace, transparent, reverse, and reverse
transparent) and two colours for those pixels which are set and those
which are cleared in the source raster. Again, both rasters have to be in
device dependent format.

vrt_trnfm(): VDI transform form
This call allows you to transform rasters from device independent (i.e.
standard) into device dependent format, and vice versa.

Ciao

Thomas

Got it; (button & bmask != bstate) when (bclicks & 0x100).

Add this to the Compendium errata list.

Word has been received that this year's MIST Atari show will be held on Saturday, July 26, in Indianapolis, Indiana. The organizers say this show, the ninth annual, will be the final one.

This year MIST is moving to the Post Road Community Center, 1313 South Post Road, on the east side of the Indianpolis area. The new location is between I-70 and I-74, outside the I-465 circle freeway.

Show hours are 10 am to 3 pm, Indiana time. Admission is one dollar. In past years this show has had displays by vendors, hardware and software developers, magazine publishers, and users groups. All kinds of Atari computers and related products can be found at these shows.

Organizers of the show are: Charlie Sears (317-535-4829), csears at doe dot state dot in dot us. Jeff Hammer (317-244-8492), jghammer at indyunix dot iupui dot edu. Stu Huffman (812-988-7558), shuffman at doe dot state dot in dot us.

d > account memory fragmentation?

If you plan to keep them in RAM until the program is done, there
will be no (or very little) fragmentation. Fragmentation occurs
when the blocks released are isolated and too small to be reused.

Pagestream uses Pexec() to load its modules (import/export and
printer drivers).

Picture file format dont' depend on the structure of the screen. In
fact, an IMG/XIMG file has teh stucture for an ATARI screen. Si if your
screen is a 256c Falcon screen, that's good. If your screen is a 256c
packeb byte screen, you have to transfom the piscture before displaying
it.
The problem is the same in TC mode: a Falcon in TC16 is RRRRRVVVVVVBBBBB
as a Macintosh (running with Magic eg) is xRRRRRVVVVVBBBBB so you have
to translate your picture.
We've made such routines for loading, dithering and so on.
Take a look a our web site for that.

An 'instal.inf' file could also be saved on the floppy disk from where
the
installation was made (which at its simplest could be a recording of
every
action/keystroke taken during the installation) as well as in the
directory
of the newly installed 'program' maybe something like ease.ins for Ease?

In the program I am currenty writing I'm wanting to be able to load seperate modules to the program so new features can be added with the addition of a module. The modules will all be loaded when the program is first executed.

Would the best way to load them be into 1 large memory block or load each module into its own block of memory taking into account memory fragmentation?
The problem I see with using 1 block is that if memory is badly fragmented then the block may not be allocated even if the system has plenty of ram free.
The memory is being allocated using m_alloc()

David

You were not doing it quite right. Remember that this feature is
frequently misdocumented. When I tried to use it, I got three different
explanations of the feature, none of which were correct! I hope the
following is correct, however, since I have tested it.

The correct method is to OR 0x100 with clicks while setting mask to cover
all the buttons you want to watch. So to wait for the left and right mouse
buttons doing either one or two clicks, clicks = 0x102, mask = 0x3.

I hope this clarifies things.

But you don't need any more "control" than what you have got. What more
control could you have, or want?

: If you are writing TTP programs, stop doing that! Think of command
: lines as a bad programming practice, maintained for backward
: compatiblity. Call fsel_input() to get any file names.

I can't imagine why you could call commandlines "bad programming practice"
or suggest that people should stop using them!

All software should, where relevant, be able to take parameters and/or
filenames on the commandline.

There is no problem with getting "long" filenames on the commandline, just
the same as there is no problem with short filenames, middle sized
filenames or anything else.

5399. New Service for your "Pager"!!!!!

Newsgroup: comp.sys.atari.programmer
Date: 1997-06-19 00:00:00 UTC
From: adfkj@woeiruffsrwwg.com
Message-ID: <5oa7b9$kvq@mtinsc04.worldnet.att.net>
Source record: 6750

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax,
pager, voice-mail, and cellular numbers and give them your New "Virtual Office"
800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone?
Wouldn't it be nice to be able to give everyone just ONE phone number that
will find you anywhere you are? Even out of town, or in a restaurant, or even
on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

If your program is intended to run on TOS only
you will run into problems if using Malloc() systemcalls.
There is a limit of ~10 Malloc() calls, after this the system
will crasch or be confused
and if writing to HD crasching the filesystem.

If using MiNT you can start child processes as modules.
Then communicate with the modules by using pipes or GEM messages.
In this way your modules will run whithout pausing your application.

GEMDOS has a lot of bugs and limitations, but it's not /that/ bad. You can safely call Malloc() more than ten times. IIRC, it gets dangerous after 30 calls or so.

If using a C-library, using malloc() is a better idea, as it Mallocs() larger chunks of memory and then handles them internally.

> If using MiNT you can start child processes as modules.
> Then communicate with the modules by using pipes or GEM messages.
> In this way your modules will run whithout pausing your application.
IPC with AES messages without a multitasking AES is only possible between the main application and accessories, but not between two processes. A much better approach for IPC with MiNT (and, with some restrictions, with MagiC 5 as well) are pipes (which have already been mentioned), shared memory and signals.

Ciao

You mean 'malloc()' I hope? Don't use 'Malloc()'. Using 'malloc()' is OK, however the quality of that call depends on the quality of your compiler's library.

>Would the best way to load them be into 1 large memory block or load

Definitely, use one specific 'malloc()' call for each module you want to load.

Regards.

Roland

5403. Memory Allocation

Newsgroup: comp.sys.atari.programmer

Going through the Magic 5 Docs I came across a call called Mgrow.
The line in the docs is

#define Mgrow(a,b) Mshrink(a,b)

I presume this is for enlarging an area of reserved memory.
Is this call only available under MagiC or does TOS support?

If TOS does not support this call is there anyway to enlarge a block
of memory that has already been allocated?

Naaah, don't do this, go the generic way, and it'll work with all resolutions,
graphics cards and other hardware. This is convert the file to VDI standard
format, then use vr_trnfm() and vro_cpyfm().

It's quite ok to do a Malloc() each time you load a module, since the
number of modules will be low, I guess. You run into trouble only (on
old TOS versions) when you do dozens and hundreds of Malloc().

Cheers Peter

Actually I'm using assembler so my compilers library has nothing to do
with it.
Acording to the Devpac3 manual the call is m_alloc (GEMDOS $48)

Thanks for the help from everyone who has answered, even if they all
assume I'm programming in C :-)

> ExecProg call and all I get is -1 in d0.
> Can ANYONE help me!?

Hi,

This is what I use for starting DSP binaries. It's taken from a devpac
macro file, but I guess you can see what's what. The ability code is just
taken, since the xbios trap for getting this returns this value if no
other program is using the DSP. It doesn't really matter if you only use
one program in the DSP.

```
Dsp_ExecProg #bincode,#(eobincode-bincode)/3,#$8001
```

Loading .lods is done with Dsp_LoadProg, but I've never used that myself.

Hope it helps,

Tomas

1) Lock the screen & mouse with wind_update()
2) use vq_mouse(handle,&mb,&mx,&my) to get the locations
3) only call v_hide_c()/v_show_c() if you have to update the rectangle

under the mouse.

It will work, honest......

To avoid memory fragmentation, the best is to use a Memory-Manager.
Wehave made a package called M&E with module to load picture, save
picture, do FXon pictures; The package also conatin a dithering module
and a Memory-Manager. You have to load it (it's an external file) and
just use it. Actually three memory-Manager which respect our concept are
available. The first just do a big Malloc() then move the block inside,
in order to avoid completly memory fragmentation. The second one use
malloc() re-alloc() and the third one use swap disk thecnik for virtaul
memory. For your programmer point of vue they are exactly the same so
the user can use the MEM he wants to, and your software will conitnue
ruuning as before.
Take a look at our web site, the licence for M&E is free.

Unfortunatly that's not enought for two reasons:
1) Transform-form don't work in TC mode. So if you try to do a Transform
form on a TC file on an ET 4000 GFX Card you get very bad things on the
screen.
2) The data format is not the inly problem: the palette order is not the
same on a GFX Card that on an ATARI machine.
```

For these two reasons, our TRM/Dithering module change the palette order
according to the card you are running on. For the data format, if you
give the TRM an ATARI picture and want to diplay it on a NOVA card, if
its a plane based picture, the TRM will give it to you in VDI Format and
after you 'll have to use Transfomr-Form but if it's a TC picture, the
TRM do the Transform_Form itself, according the the bit order of the
card.

Allocate a new block of the desired size, copy the old contents and free
the old block. This is called realloc() in C.

I have never read any Magic doc, but redefining as 'Mgrow()' a system call
which actually shrinks an allocated block sounds weird to me...

> under the mouse.
>
> It will work, honest......
It's not a good idea to use the v_xxx-calls for the mouse, especially
v_hide_c() and v_show_c(). AES and VDI keep separate countes for
graf_mouse() and v_xxxx_c(), so it may lead to strange effects (mouse
pointer disappearing) if a program that used v_hide_c() either crashes or
forgets to unhide the pointer on exit.

There are two AES-calls to determine the current pointer coordinates and
one to hide/show the mouse, and I don't see any reason not to use them.
It's even better to use mouse rectangle events which actually wait for a
movement instead of a busy-waiting loop with vq_mouse().

Ciao

Thomas

Hi,
I have a lot of measurement data files that were produced under
GFA-Basic 2.0. The files contain a binary array of float variables (6
bytes). As I do not longer have an Atari at hand, I would like to
convert these files to be input into Windows Programs (sorry).

Can anybody help with information on the bit-wise encoding of the 6
byte IEEE float format used in GFA-Basic or does somebody have a C
routine that performs the conversion to 4byte float or 8byte double?

thanks
Stefan

Oops. I believe that I've made a booboo. I was thumbing through an old
issue of a programmers mag (DDJ) and I mistakenly linked RTI to Untel,
whereas the x86 instruction is actually "IRET"

Correct but not viable for me as there may not be enough memory to hold both
the new block and the original block in memory at the same time as I'm
dealing with sound samples which can be extremely large.

They don't call it the "40-folder bug" for nothing. You'd think the
TOS programmers were Arabic or something. ("40" == "Infinity" in
mid-east traditions... thus - "Ali-Baba & the 40 thieves", the
Great Flood lasting 40 days & 40 nights, etc...)

Well, using MiNT, you ought to get hold of a multitasking AES. Like
XaAes or something...

m > programming practice" or suggest that people should stop using
m > them!

Making your programs difficult to use (requiring users to memorize
command line parameters) is a bad programming practice, period.

You've got a GUI on ROM, for goodness sakes! Learn how to use it!

m > There is no problem with getting "long" filenames on the
m > commandline, just the same as there is no problem with short
m > filenames, middle sized filenames or anything else.

There is a 128 byte limit on the command line in the program header,
so if you have a REALLY long filename, or more than one filename...

Digital Data Promotions Online is pleased to present a new yellow pages style listing of businesses on CD-ROM. This listing will include links to your businesses web site, text, graphics, picture, as well as audio and video clips; to bring your business into the world of multimedia advertising. In addition, any ads promoted on the CD will also be listed on our web site, in the same cataloged method, and updates to your information will be possible. We are currently promoting this CD across the US and the world, and space is filling up quickly. For further information you can visit our web site at

http://www.intergate.bc.ca/business/ddpo

Or download a quick demo of the program, and pricing list, with attached order form at

http://www.intergate.bc.ca/business/advert.exe

We hope to see you online soon.

Thank you for your interest.

Any questions or comments can be directed to

> Great Flood lasting 40 days & 40 nights, etc...)
grin But what do you want to say? The 40-folder-problem has been fixed
in TOS 1.04 (i.e. the info about folders which are no longer in use get
cleared), so it's very unlikely to overflow the GEMDOS-pool with folders.
You can do so by calling Malloc() too often (or by playing around with
output redirection, which has never fully worked in plain TOS), but you
can call Malloc() more than 10 times (which was denied in the posting I
have replied to).

>>IPC with AES messages without a multitasking AES is only possible between

> Well, using MiNT, you ought to get hold of a multitasking AES. Like
> XaAes or something...
But pipes, shared memory and signals have the advantage that they work
without a multitasking AES and can be used by non-GEM-applications as
well. What's really missing is an Fselect()-mode for evnt_multi() ...

Ciao

> dealing with sound samples which can be extremely large.
If you need the samples to be in one contigous block of memory, than
there's no better way. If it's possible to use a linked list of smaller
blocks for your purpose, this would be a solution. I had the same problem
when I wrote the Ramdisk-XFS for MagiC, and after switching to a linked
list of 1K blocks, the problem was gone. The only problem with this
approach is that writing to the ramdisk is quite slow (compared to
reading and to writing to a "conventional" ramdisk) because of the many
Mxalloc()s ...

Ciao

Not allowing people to pass filenames to a program when they run it is
even worse. Period. And no one was talking about a command-line-driven
user interface, anyway.

> You've got a GUI on ROM, for goodness sakes! Learn how to use it!
So, if you want to edit three files at the same time, you prefer to run
the editor, use "File: open" three times instead of just dragging the
three files onto the editor's icon in the desktop? Even if so, I don't think
this is what mose people expect from a good GUI.

> There is a 128 byte limit on the command line in the program header,
> so if you have a REALLY long filename, or more than one filename...
Never heard of the ARGV-parameter-passing-scheme? It was created by Atari
many years ago, to allow commandlines of unlimited length (and to have
argv[0]). And the limit you mean is not in the program header, but in the
basepage.

Ciao

I might as well say this here and now:

There will be a JVM with JIT for Fenix. I'm currently working with a
group of Amiga programmers porting Sun's JVM to Amiga (and Atari).

We are using Sun's JVM sources but are rewriting a lot of the
interpreter
and are adding a JIT. My responsibilities in this project are the JIT,
rewriting of the interpreter and the porting to Fenix.

Fenix's kernel has been designed with Java (and Limbo) in mind and there

is a OO dynamic linking scheme being designed so that native code can
be used simply in "Java" programs. This makes it possible to use Java
as a simple glue and script language for GUIs and other non performance
critical applications.

We have worked from time to time for over a year on this project and
have had working Amiga prototype versions for nearly a year. The JVM is
capable of running javac compiling javac ie itself.

I cannot say who the Amiga programmers are and why we are doing this at
the
moment but it will be clear in a couple of months.

Regards Sven Karlsson - Istari software

I believe you mean "basepage" rather than "header".

And I believe that the limit is 126 bytes, not 128. AFAIK, the command line that appears in the basepage is a C-ised Pascal string (ie zero/null terminated and length-prefixed).

The basepage has 128 bytes of space of which the first byte is the length of the command line, then the command line, and a zero byte at the end of it.

(I also seem to recall something about a double null-byte, which would reduce the command line length from 126 to 125)

People have written be being somewhat confused and asked be about the
phoenix
project. I will say this once and for all:

Fenix is not phoenix and it has nothing to do with it. Fenix is a OS
being written by
me while phoenix is a computer under development by centek in france. I
have written
some letter to centek asking about the phoenix but have never got any
reply so I don't
know anything about the phoenix apart from the information centek has
released to the
public. Centek hasn't updated their pages for a long time now which
honestly makes me
wonder what thay are doing. I have also spoken to some french
programmers connected
to Centek. They didn't say anything about the phoenix and wouldn't
answer my questions.

I admit that Fenix might be a bad name for the OS but I chose the name
long before I even
heard about the phoenix. (Fenix was previously called first Galaxy and
then Garden).

If anyone has a better name for Fenix you can email me and I will
consider it!

As far as I remember, Pure C also has putenv() or setenv(). Look what
functions containing "env" you can find in stdlib.h of Pure C's include
directory, this may help. (Sorry I can't tell you more right now, but I
don't have my Atari here ...)

I was (specifically, TTP programs). OTOH, allowing the desktop to
pass 1 filename via the command line is part of the GUI, and SHOULD
be implemented.

g > Never heard of the ARGV-parameter-passing-scheme?

I mentioned passing arguments using environment variables.

g > And the limit you mean is not in the program header, but in
g > the basepage.

Sorry, couldn't remember the right word at the time.

In any case, the issue turned out not to be the 128 byte limit, but
rather replacing Fsfirst() with Readdir() and Fxattr(). (Help with
MiNT filenames)

Hi!

In article <a5a_9706241113@conchbbs.com>,
John.Kormylo@7861.conchbbs.com (John Kormylo) writes:
> g > And no one was talking about a command-line-driven user
> g > interface, anyway.
> I was (specifically, TTP programs).
You said that one should stop writing TTP-programs and think of using the commandline as being bad practice which should be avoided, not restricting the latter to using it as a user interface.

I don't subscribe to either point of view, because TTP programs are often faster (not only in terms of execution time, but also regarding the time you need to tell the program what it should do), may be used in the Auto-folder as well, and are often the only senseful solution to a problem. Would you write an input/output filter which is only used as an overlay for a GEM app with a GUI of its own? Of course, when it comes to full user interaction, a GUI should be used whenever possible.

And I also don't think of using the commandline is bad programming practice (and I include AGRV to that, as it's just a way to expand the length of the limited basepage-commandline). You can drop files (and not only one) onto an app's icon, or you can for example use it for some special features of the application which don't involve the user interface or to allow "power users" to get the most out of the program.

> OTOH, allowing the desktop to
> pass 1 filename via the command line is part of the GUI, and SHOULD
> be implemented.
So I ask you again: If you want to edit three files, you drop one onto the editor's icon and open the remaining two files via "File: open"? Even Atari's Newdesk allows dropping more than one file, so why should one restrict it?

> g > Never heard of the ARGV-parameter-passing-scheme?
> I mentioned passing arguments using environment variables.
ARGV is realised by using an application's environment, but you don't put the arguments into environment variables. You may call that nitpicking, but with only speaking about environment variables, I don't automatically think of ARGV.

> In any case, the issue turned out not to be the 128 byte limit, but
> rather replacing Fsfirst() with Readdir() and Fxattr(). (Help with
> MiNT filenames)
Which I also replied to ;) But it's also important to think about the commandline (and the Drag&Drop protocol) when dealing with long filenames,

because these may contain spaces and then have to be quoted (not in the
ARGV environment, but in the basepage's commandline, which has to be
filled anyway).

Ciao

%> Well, using MiNT, you ought to get hold of a multitasking AES. Like
%> XaAes or something...
%But pipes, shared memory and signals have the advantage that they work
%without a multitasking AES and can be used by non-GEM-applications as
%well. What's really missing is an Fselect()-mode for evnt_multi() ...

Exactly. And that's the sort of thing I would look for in an AES replacement.
What we need to have happen:
All events - keyboard, mouse, button, timer, message - need to be
turned into AES messages. Implement AES message pipes using MiNT pipes (or
even MiNTnet sockets, for that matter). Provide the descriptor number of
the message pipe to the user - preferably in the appl_init results. Then
evnt_multi itself just turns into an Fselect call, and you can use Fselect
yourself on the message pipe in addition to the other descriptors you're
interested in.

ONLY AVAILABLE IN THE:
U.S.A, VIRGIN ISLANDS, AND PUERTO RICO CANADA*

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax,
pager, voice-mail, and cellular numbers and give them your New "Virtual Office"
800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone?
Wouldn't it be nice to be able to give everyone just ONE phone number that
will find you anywhere you are? Even out of town, or in a restaurant, or even
on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web site:
http://www.mynumber.com

* Based on our best priced plan.
* Canada has a higher per minute rate.

5455. gfa 2 to 3.5 conversion

Message-ID: <5p0ma7mdv1@news.pacifier.com>
Source record: 6656

WV> Is there a utility to convert gfa 2 to 3.5 out there?

I've never seen a specific utility to make the conversion, but you should be able to find the GFA 2.x interpreter in the public domain. Many BBS's and I'm sure a few internet sites have it online.

Load your program into GFA 2.x, and write it out as an ASCII text file (.LST format). Then, fire up GFA 3.5 and merge the ASCII text file in. Save it back out to GFA 3.5 format if you wish.

I'm not sure what syntax differences there are between the two versions, and the success of the translation will certainly depend on the program. If it uses nothing but simple BASIC commands, you shouldn't have any problems.

Good luck,

Anthony Watson

We are accepting new and previously published writers for publication. We are a NEW YORK based international literary agency with three offices: 2 in NEW YORK and one in FLORIDA. Please follow guidelines for submission:
For all fiction, including screenplays for TV & Movies: Send us a brief synopsis, the first chapter, and include a self-addressed, stamped envelope=S.A.S.E.
Short Stories: Send brief synopsis, 3 pages, S.A.S.E.
Poetry: Send 3 poems, S.A.S.E.
For all nonfiction: Send us a brief synopsis, the first chapter, and include a S.A.S.E.
Do not send complete manuscript unless invited.
WOODSIDE INTERNATIONAL LITERARY AGENCY>>>
33-29 58 Street>>>

I dunno about putenv() but all you need do is copy the current
environment to a new memory block and add space for your new
variables, then pass the new pointer to Pexec(). The child process
will then see the new environment.

>>This is absolutely correct.

.. for a minimal realloc() implementation, bearing in mind that C may
have grabbed a larger block than originally requested so in cases
where you are realloc'ing slightly larger blocks each time C may not
have to go back to the system for quite some time.

>Correct but not viable for me as there may not be enough memory to
>hold both the new block and the original block in memory at the same
>time as I'm dealing with sound samples which can be extremely large.

Probably the only brute force solution is to try Malloc'ing a new
block and if it fails dump the old block to disk, free it and try
again. A more subtle method, if possible, would be to use a linked
list of some sort whereby the sample can be spread over fragmented
memory blocks?

>which actually shrinks an allocated block sounds weird to me...

It's simply an extension of the standard TOS Mshrink() call. iirc,
pass it a negative value and it attempts to enlarge the block. Without
full documentation on it, it is difficult to do more than speculate
that it is a function used by MagiC internally so that it can resize
the TPA. ie I'm guessing that it is really only useful while MagiC is
singletasking - there seems little point in it allocating a distinct
fresh block and releasing the old as this is possible anyway. ;-)

>Is this call only available under MagiC or does TOS support?

Nope, TOS does not support it. It's a nice idea under MagiC but I
doubt it would be of much practical use when you take multitasking
into account.

>If TOS does not support this call is there anyway to enlarge a block
>of memory that has already been allocated?

Not really. You'd have to have intimate knowledge of the memory
manager and even then you'd be no better off than MagiC - if there's a
block allocated in desired space above then you would not be able to
extend the block under TOS either.

Boy did I screw that one up! All I can figure is that I
mis-translated the 1.0 German docs and never bothered to check the
ANSI docs for system(). Even the 1.1 German docs for system() are
obviously not about setting environment variables (unless you use
SETENV).

OTOH, putenv() is not in the standard library at all. (The reason
for this is that the default environment is not expandable.)

The instructions for Pexec() are still good, though.

```
b > I have no any trace about putenv in my documentation, in my
b > *.h files (PureC1.1) to :( i need Pexec a program with
b > additionnal environnemment!!

The function is system() and is found in stdlib.h along with
getenv(). However, whenever I call system() it crashes. Looking at
the code with the debugger, I see that it uses the _shell_p system
variable, so it probably requires that you install a shell program
for it to work.

There is also an AES call, shel_envrn(), which does the same thing
as getenv().

To SET an environment variable when using Pexec(), simple create a
string consisting of the appropriate environment, such as

static char* env = "mypath=C:\\clipbrd\0";
/* Don't forget the extra NULL terminator */

then use this pointer in the Pexec() call for the envrionment
pointer.

To ADD an environment variable, copy the entire environment into a
new buffer and append your string to the end (before second NULL in
the double NULL terminator). Or vice verses.

The default environment for programs called via shel_write() is not expandable, but the one used by Pexec() is, which is what putenv() would do (I don't know whether the Pure C- and/or the MiNT-Libs have this call). Pexec() uses the parent's environment as default, and this may be changed by altering p_env in the basepage. AFAIK, this is documented.

Of course, you also have to create a copy of the original environment and alter it afterwards for this to work, but a library call which does so automatically would be much more convenient.

Ciao

Thomas

Actually, it is in Geneva and MultiTOS. There is a new mode of
shel_write() (off the top of my head I think it's 9 or 10), which does
this.

>but the one used by Pexec() is, which is what putenv() would

Yes, a Pexec() with 0L as the basepage pointer parameter will cause the
parent's basepage to be used instead. So if you putenv() the vars to your
own basepage and then Pexec() a child, it works.

>Of course, you also have to create a copy of the original environment and
>alter it afterwards for this to work, but a library call which does so
>automatically would be much more convenient.

...at which point you might as well just pass the env to Pexec() instead
of using 0L...

> extend the block under TOS either.

However, if Mgrow() is intelligent and knows whether a block is allocated
just beyond the one that needs to be grown, then it could simply do
something like the following:

```
if( !inuse( memory_just_beyond_this_block ) ) {
zero( end_of_this_block + 1, newsize - currentsize );
return success;
}

pointer = Malloc( newsize );
if( !pointer )
return failure_code;
memmove( pointer, oldbuffer, size_of_oldbuffer );
Mfree( oldbuffer );
return pointer;
```

The second part (allocate new, copy, release old) is somewhat like what
the C realloc() call does, if I am not mistaken.

Quote For The Month:

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a _really_big_ instruction manual - and even then, it takes me half an hour before I can start to drink, because there aren't any pictures showing me how. But with the Pure Water Distiller, they include a simple one-page leaflet - WITH PICTURES!! - that show me how to drink water...

Why zero the memory? Malloc() and Mxalloc() don't do so, so why should an
Mgrow() do it?

> The second part (allocate new, copy, release old) is somewhat like what
> the C realloc() call does, if I am not mistaken.
The whole routine is more or less what realloc() does if the new block is
larger than the old one. But the name Mgrow() for me implies that the
address of the block is untouched, as it is with Mshrink().

Well, OK, I forgot that. But honestly I don't think it's a good idea to
alter the AES' default environment from within an application - or would
this call just affect the AES environment of the calling app? I don't
have the docs here right now ...

>>Of course, you also have to create a copy of the original environment and
>>alter it afterwards for this to work, but a library call which does so
>>automatically would be much more convenient.
> ...at which point you might as well just pass the env to Pexec() instead
> of using 0L...
When you don't have putenv() or something similar, it's maybe better to
do so (however, the basepage method is still the better solution if you
are going to use some library call like system() or popen()).

Ciao

How "old" is Mgrow?

If it is a recent addition, then we can assume that programmers using it know that the "new" memory (beyond the end of the old block) could contain anything - and not be zeroed like a lot of older programs expect from Malloc, which, AFAIK, doesn't zero memory, either.

But then, that relies upon programmers being intelligent, and we all know this is a biological impossibility ;)

(Sidetrack: Any chance of an update to TOS to give Mxalloc a "zero" flag [which will zero the memory block]. eg Mxalloc(456, LOAD_TT|ZERO|PRIVATE) or something similar?)

> address of the block is untouched, as it is with Mshrink().

... which begs the question: Why didn't they call it Mrealloc?

Perhaps it creates a larger block, copies the old, and then reprograms the CPU's MMU (on '030s, full '040s or better) into thinking that the old block is still at the same place, just slightly bigger?

Quote For The Month:

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a _really_big_ instruction manual - and even then, it takes me half an hour before I can start to drink, because there aren't any pictures showing me how. But with the Pure Water Distiller, they include a simple one-page leaflet - WITH PICTURES!! - that show me how to drink water...

Why? You can always do that yourself. This is nothing you need a kernel
for.

No, it modifies the env for the entire AES. I agree that if all you want
to do is execute a child with a particular set of vars, it's a very bad
idea to be changing the AES's env. You should be using the extended modes
of shel_write() instead.

Agreed.

However, one could also argue that "allocating a memory block and readying
it for use" could be considered a kernels job.

Which unfortunately have the same inconveniences as Pexec(), if you just
want to /add/ new vars to the existing environment ...

>> P.S.: Any special reason for this large gap which causes the address to be

After allocation a memory block is already ready for use. In most cases,
you allocate a block to fill it with data afterwards, and (at least I)
almost never need it zeroed before filling in data.

Ciao

Thomas

P.S.: Your "Quote For The Month" may be funny, but a) it's far too long
for a .signature and b) gets annoying if found in each posting. So,
could you please reduce the length and the frequency of posting?
Thanks.

From: Michael Waters <waterses@worldnet.att.net>
Message-ID: <01bc87cf$199b00e0$3b7174cf@cmwaters-h>
Source record: 6687

Hiya;

I am working on an assembly language program and have a problem. My program needs to execute a routine precisely every 1/120 second. The actual routine is a doddle, plenty of time to sit and wait between executions, but I have no idea how to achieve precise timing.

Any suggestions?

thanks
myeck waters

5493. $ DO YOU HATE YOUR JOB?? $

Newsgroup: comp.sys.atari.programmer
Date: 1997-07-04 00:00:00 UTC
From: a20@a.a
Message-ID: <33bcae82.0@news.genesisnetwork.net>
Source record: 6694

$50,000.00 for only $5.00 within 2 MONTHS?????
==========

You gotta be crazy! How on earth do you think you can buy 50 grand
for lousy 5 bucks? Well, that's what I was wondering, too until I
came across this letter.

First of all, IT'S PERFECTLY LEGAL! (Call 1-800-725-2161) if you
have any questions about the following opportunity to make
$50,000.00 and that probably WITHIN LESS THAN TWO MONTHS!

Well, here it goes:
A little while back, I was browsing these newsgroups, just like you
are now, and came across an article similar to this that said you
could make thousands of dollars within weeks with only an initial
investment of $5.00! So I thought, "Yeah, right, this must be a joke,"
but like most of us I was curious, so I kept reading. Anyway, it said
that you send $1.00 to each of the 5 names and address stated in the
article. You then place your own name and address in the bottom of the
list at #5, and post the article in at least 200 newsgroups. (There
are thousands) No catch, that was it.

I knew that that was the opportunity I had waited for for a long time.
I thought it was about time that the money of the world gets into the
right hands! OURS, right? I never had a doubt that this thing will
actually work and even if it didn't, what were 5 stamps and $5.00 for
a try?

As I mentioned before, like most of us I was a little skeptical and
a little worried about the legal aspects of it all. So I checked it
out with the U.S. Post Office (1-800-725-2161) and they confirmed
that it is indeed legal!

Now, that's how your story WILL sound like, too if you participate:

Well GUESS WHAT!!... with in 7 days, I started getting money in the
mail! I was shocked! I still figured it would end soon, and didn't
give it another thought. But the money just kept coming in. In my
first week, I made about $20.00 to $30.00 dollars. By the end of the
second week I had made a total of over $1,000.00!!!!!! In the third
week I had over $10,000.00 and it's still growing. This is now my
fourth week and I have made a total of just over $42,000.00 and it's
still coming in ....

Let me tell you how this works and most importantly, Why
it works....also, make sure you print a copy of this article NOW, so
you can get the information off of it as you need it. The process is

very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 Robert Jezil
114 Jefferson Ave.
Slidell, LA 70460

#2 Phil Walther Jr.
9495 Annapolis Lane North
Maple Grove, MN 55369

#3 C. E. Burkman
170 University Ave. W
Suite 12-129
Waterloo, Ontario
N2L 3E9

#4 A. Bailey
1207 Reeves Road
Plainfield, IN 46168

#5 J. Martin
P.O. Box 2292
Reston, Va. 20190

STEP 2: Now take the #1 name off the list that you see above, move the other names up (2 becomes 1, 3 becomes 2, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:
1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL YOU SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this right , you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:
It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now the WHY part:

This entire principle works because it is in a format of an upside down tree with thousands of branches. Everyone below you will see to it that the tree continues because they want to get money. Those below THEM will continue because THEY want to get the cash etc.

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM of 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00
at #4 $225.00
at #3 $3,375.00
at #2 $50,625.00
at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 and start posting again.
The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! And this will go on and on and on and on.... get the picture? Well, there's 5,000,000,000 people on the world and most of them will eventually end up being hooked into the internet. So there are virtually unlimited resources. Of course this will work the best at the very beginning so the faster you post, the better for YOU!

So can you afford $5.00 and see if it really works?? I think so! People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again...

5494. Re: Assembly Programming Question

In article <01bc87cf$199b00e0$3b7174cf@cmwaters-h>,
"Michael Waters" <waterses@worldnet.att.net> writes:

> I am working on an assembly language program and have a problem. My
> program needs to execute a routine precisely every 1/120 second. The
> actual routine is a doddle, plenty of time to sit and wait between
> executions, but I have no idea how to achieve precise timing.

Program one of the timers inside the MFP (there is one unused) to expire
120 times a second, and set it up the cause a 68000 exception (interupt).

There is no guarantee though that the handler is called *each* time at the
right time, as there might be a higher priority interupt in service at the
time, but that should happen rarely.

Cheers Peter

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.
SEND TO: Photo Phoenix International

One-Number service puts you in control of your calls while ensuring that your calls, messages and faxes reach you regardless of your location. One-Number service does this by linking your existing telephones, cell phones, pagers, and fax machines through a single telephone number.

YOUR One-Number ACCOUNT COMES STANDARD WITH THESE FEATURES
- Consolidates your phone, fax, voice-mail and paging services
- Works with your existing products and services, no need to change
- Easily lets you designate yourself as available or unavailable
- Rings you at up to three numbers simultaneously
- Never-busy number accepts multiple incoming calls and faxes
- Call Screening (by name) lets you know who is calling
- Call Waiting lets you know somebody else is calling
- Call Move lets you easily transfer calls among different phones
- Call Conferencing allows conferences with other parties
- Fax Notification on your pager for incoming fax messages
- Redirect calls to Personal Operator (live person) if desired
- AND MUCH MORE

Virtual Office Communications Company is not a phone company, a long distance carrier, nor do we sell telephone equipment, cellular phones, cellular service, pager or pager service.
Instead, we offer service to integrate your existing products, adding value to what you already have by letting your phones, pagers, fax machines and voice-mail systems work together seamlessly.

To learn more please visit our web site at: http://www.mynumber.com

Please do not reply by e-mail as we are not set up to respond to e-mail requests.

hello experts,

i'm planing to to connect an atari tt8 to an existing nt/w95 -
ethernet netwok - here my questions :

1. what harware do i need for the tt8 (networking card ?) and where
can i get such a thing .

2. what software do i need to use at least the harddisks, cd-roms,
worms, printers, modems and isdn-cards on the pc based part of the
network - via tcp/ip.

3. as i use a swichboard to use just 1 keyboard,1 mouse and 1monitor
on up to 6 different pc's at the sysops room - can there be a solution
for the tt either - means using a com port mouse and a standard pc
keyboard on the tt - monitor should work as far as i remember my atary
days ...

I've just taken the possibly foolish option and upgraded my Falcon from MagiC5.03 to 5.11!

Of course, in true MagiC tradition, there are *no* upgrade instructions and *no* docs at all about what the differences between these two versions are!!

Why do these arrogant programmers feel there is no need to document version changes. What bloody planet are they on????

System Solutions seem to be plugging the fact it's MagiC 5.1 (but as they've already screwed up my upgrade, I suspect they will be of no use in telling me what the differences are). They could almost be Microsoft Dealers for the amount of knowledge they seem to posses about what they sell!!!!!!!

Can anyone in these groups:

a) List the differences between 5.03 and 5.11?
b) Tell me where I can find programmer docs for 5.11?
c) Tell me how to turn *off* the 'realtime' windows. Lovely at first, but now becoming annoying!!

Well... it's a bit long to explain it, not because it's hard to
understand, but if you don't know exactly what is the MFP and if you
don't have documentation on it, I suppose that you're NOT a fanatic of
interrupt. The problem is that putting on an interrupt is an easy thing
for a demo (I dont' save anything and if it crash at the end, it doesn't
matter) but in a "clean" way, argll!!! It's not so easy. Same for
cleaning interrupt correctly at the end (espacially in a multitasking
context). And debugging something in interrupt is hard.
So, two possibilities:
1) You explain us exactly what you want to do, and we all try to find
the easiest way for doing that, perhaps without interrupt.
2) I "zip" you some pieces of code, 5 Kg of coffee and 2 kg of aspirine,
and you try. 8-))

5513. Slider Algorithms

Newsgroup: comp.sys.atari.programmer
Date: 1997-07-10 00:00:00 UTC
From: Ben Hall <cb170@city.ac.uk>
Message-ID: <Pine.GSO.3.95.970710145010.24551B-100000@swindon>
Source record: 6714

Hi guys,

I'm trying to code up some completely generic resource slider routines, and I need some help. Apologies if my description is not terribly good, as this is quite a complex problem that has stumped me for a while.

There are two fundamental approaches to implementing this. The first is to follow (as much as possible) the descriptions of the slider routines in ProGem. To avoid roundoff problems the ProGem routines describe using a range of 1-1000 for the travel of the slider, which is used for the wind_set call, which sets the pixel size of the (window) slider internally. As I can't use the wind_set call for a slider within a resource, how do I convert that 1-1000 range into the absolute pixel value? (This sounds easy but it's more involved when the slider size, slidebar size and the various document units are all completely variable)

If for these sliders you don't use a large range and instead base everything on pixel values, I get problems with roundoff errors. Basically my slider routines work for dragging the slider, the size is worked out using the proportion of the total document to the visible document. The problem is positioning the slider by lines - depending on the interaction between the document sizes, slidebar and slider sizes, one line is not necessarily an equal number of pixel steps. So when I move the slider down one line (by clicking on the down arrow, say) I need to know whether to position the slider by (say) 7 or 8 pixels to position it correctly. Take a look at how Selectric's slider works to understand what I mean. I've tried to decode E_Gem's slider routines but not being a C programmer it's pretty confusing.

I hope I'm getting across what I need to get across!

Thanks in advance... (BTW I'm using GFA if it makes any difference)

It's called SET_FLG.CPX and its location on the installation diskette is
A:\MAGX_2\CPX\SET_FLG.CPX.

Check your CPX folder, maybe you just haven't activated it?

Oh sorry! 8-)

In v5.1 you can have the windows to update in realtime when using the
horisontal and vertical sliders. However, I must say I prefer the
"ghostbox".

Take care,
Daniel

Well, even 5.0x had realtime /sliders/, IIRC. What 5.1 adds is realtime
sizing and moving of windows, just as it is with using WINX and SingleTOS.

Ciao

Thomas

> and you try. 8-))

You're right, in all these years I've never needed to use interrupts before, mostly I wrote simple little utils (the most complex thing I ever did in assembly on an ST was a prg to convert "PCB DESIGNER" board layouts to IMG bitmaps, which certainly didn't require interrupts). I have some docs on the MFP registers, etc, but nothing that actually shows how to go about dealing with it.
The program I'm working on is strictly for my own use. I have a home recording setup, and both my MIDI sequencer and my hard disk recorder sync to MIDI Time Code (MTC), but neither will generate it, so the only way I can sync the two together right now is to run an analog tape with SMPTE time code on it and sync to that (which wears out the tape and the deck, and wastes time waiting for rewind). Since I have a few "spare" STs sitting around, I figured I'd set one up to generate MTC. For the flavor of MTC I want, I need to spit out code every 1/120 second.
The machine certainly wouldn't be multitasking. All it'll be doing while generating the MTC is checking for keypress or maybe mouse click (strictly in a start/stop capacity) and waiting for the interrupt.

Any help you can offer is appreciated.
myeck waters

No prob, you prefer ghostbox, just press CTRL key while moving.
If you want to have ghostbox as default, and CTRL key for realtime, go
in the INF and put flg=6.

> program needs to execute a routine precisely every 1/120 second. The
> actual routine is a doddle, plenty of time to sit and wait between
> executions, but I have no idea how to achieve precise timing.
>
> Any suggestions?

OK, there are a few ways you could go about this but I think the best
method
is to use the ST MFP Timer A. On the STE this is normally used to count
frames from the sound DMA chip, however it can be reprogrammed, you
should be
aware that any software that makes use of the sound DMA may not work
properly
with this routine installed.

```
TACR equ $fffa19
TADR equ $fffa1f

move.b #$7,TACR ; select 12,288hz
move.b #$67,TADR ; set 103 decrements between ints.
```

This will cause an interrupt 119.3 times per second which is just about
as
close you can get to 120. Now you have another choice to make, do you
want to
detect the interrupt through the 68k level 6 autovector or more simply
just
use the MFP hardware bound interrupts. For simplicity I'll go with the
latter. So here is a complete routine to install your interrupt:

```
install:
bclr #5,$fffa07 ; disable Timer A interrupt
move.l #myrout,$134 ; store your routine
move.b #$6,TACR ; select 12,288hz
move.b #$67,TADR ; set 103 decs. between ints.
bset #5,$fffa07 ; enable Timer A interrupt
rts
```

Your routine should end with 'RTS' and not 'RTE' as you might expect.

Hope this is helpful, Jr.

>slider within a resource, how do I convert that 1-1000 range into the
>absolute pixel value?

Er, don't - until absolutely necessary. Keep track of things as
percentages of the whole.

>(This sounds easy but it's more involved when the slider size,
>slidebar size and the various document units are all completely
>variable)

Things are simpler if you take an abstract approach. Think of a
"document" as consisting of so many "units" (unit_off below) and the
"window" as being able to display a certain amount of those units at
any one time (unit_vis below). The portion of the "document" being
displayed can also be denoted as a 'unit offset' from zero (unit_off
below).

```
slider_position = (1000 * unit_off) / (unit_tot - unit_vis)

slider_size = (1000 * unit_vis) / unit_tot
if slider_size > 1000 then slider_size = 1000 /* for window > document */
```

To figure out which bit should be displayed from the slider ...

```
unit_off = ((slider_position + 1) * (unit_tot - unit_vis)) / 1000;
```

... note that 32 bit math is needed to maintain precision.

>If for these sliders you don't use a large range and instead base
>everything on pixel values, I get problems with roundoff errors.

>Basically my slider routines work for dragging the slider, the size is
>worked out using the proportion of the total document to the visible
>document. The problem is positioning the slider by lines - depending

>when I move the slider down one line (by clicking on the down arrow,
>say) I need to know whether to position the slider by (say) 7 or 8
>pixels to position it correctly. Take a look at how Selectric's slider
>works to understand what I mean. I've tried to decode E_Gem's slider
>routines but not being a C programmer it's pretty confusing.

Well, stuffing some values into the above formulas. Let's say we have
a 250 line document, our "window" displays 12 lines and the top line
in the window is line 57 (there is a line 0).

slider_position = (1000 * 57) / (250 - 12) = 237
slider_size = (1000 * 12) / 250 = 48

This translates into 237 tenths of a percentage and 48 tenths of a
percent, so the slider size is 4.8% of its maximum size and is
positioned 23.7% of the way along.

For arguments sake, lets assume you constructed your resource where
the slider has a GBOX under it (ie parent of the slider) which is
exactly the full size the slider can be. Let's also assume this is a
vertical slider ...

When you want to adjust the slider, set ob_height[SLIDER] to 4.8% of
ob_height[GBOX], and set ob_y[SLIDER] to 23.7% of ob_height[GBOX] then
objc_draw the GBOX. It's best to check that the new and current
heights are different before objc_draw to save unnecessary drawing.

Another improvement would be to only use objc_draw if the mouse
happens to be over the slider, else use the VDI so the mouse stays on.

>I hope I'm getting across what I need to get across!

So do I else I've answered the wrong thing! <G>

Here's a bit of code which also shows one or two things I've not
mentioned. Sorry, its in C ...

Is there a way to alter the memory protection status of a block of
allocated memory?

For example:

```
pointer = Mxalloc( size, TT|PRIVATE );
...
(Do something with memory block)
...
Mtype( pointer, SHARED );
```

where the "Mtype" function alters protection from PRIVATE to SHARED

Quote For The Month:

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a
_really_big_ instruction manual - and even then, it takes me half an hour
before I can start to drink, because there aren't any pictures showing me
how. But with the Pure Water Distiller, they include a simple one-page
leaflet - WITH PICTURES!! - that show me how to drink water...

Your best bet would be to use Timer A if it's available which can be
set up to count clock cycles for you. If you want further information,
then mail me and I will sig out some of my old source codes and docs.

Mark.

Oh yes. I just tried that. I also found that double clicking on a window's
menu bar, hides the body of the window and just leaves the bar. This is
really, really nice!! :) Double clicking again, brings it back. Cool :)

I just think it's a shame there's no documentation on these new features :(

Gary

Ben Hall (cb170@city.ac.uk) wrote:

: I'm trying to code up some completely generic resource slider
: routines, and I need some help. Apologies if my description is not
: terribly good, as this is quite a complex problem that has stumped me
: for a while.

IMHO there should be a complete slider object available, but since there isn't, it is necessary to to it by hand.

: Thanks in advance... (BTW I'm using GFA if it makes any difference)

Well I can't help with GFA (Basic?) but I can help with the sliders in general.

The problems you are having seem to be mostly related to converting the logical 1-1000 scale to the pixel positions onscreen. You can do this with this simple formula. It will convert between any two scales:

source_value * dest_range / source_range

So to convert your 1-1000 scale to the pixel scale of the slider (assuming the slider is 100 pixels high) you could use:

pixel_position = logical_position * 100 / 1000

To convert a pixel value back to a logical value (useful when the user drags the slider to a new position) you would use:

logical_position = pixel_position * 1000 / 100

Note that the 100 would be better replaced with a way of determining the slider height, such as tree[object].ob_height. This way adjusting the slider size in the resource would not require a change to the program.

Note that you could also convert directly between document size and slider size in the same way:

pixel_position = position_in_document * slider_size / document_size

and

position_in_document = pixel_position * document_size / slider_size

In any case, with that you should be able to do all the conversions you need. You probably want some functions for manipulating the slider, such as:

set_slider_position(position , range)
this will allow you to do things like:
set_slider_position(current_position_in_document , document_size)

get_slider_position(range)
this will enable things like:
position_in_document = get_slider_position(document_size)

You will want similar functions for setting the size of the slider.

In most cases, you will also find it necessary to copy areas of the
display that are still visible during scrolling, rather than redrawing
them. For example, if the user scrolls down one line, only the one new
line should be drawn, the rest should be copied up on the screen by the
size of one line. Remember that it is not as simple as copying the whole
document display area, though - the rectangle list must be observed at all
times.

I hope this has been of some help. If I can be of further assistance,
don't hesitate to ask.

Am I right in thinking this is for showing a text document.. does the formula offered take into account a document with less lines than the scroller ie: scroller=100 pixels.. document=70 lines, but a slidebar is still needed because the document is longer than a visible page?

I have a slider in STOS BASIC that I use for displaying documents in diskzine shells, check out any edition of ST+ Diskmag and you can see it.. works for all size documents small or large.. it is a progresion bar.. but easily changed to slider as can be imagined:)

Thanks for the code. I'll look into it in a few days when I have the time.

But - is 119.3 really as close as you can get? For this project I really
need to get well within the 119.9-120.1 range. I'm beginning to think I'll
have to tack an oscillator on the cart port.

thanks again

5538. $$ LOAN BUSINESS, EASY MONTHLY INCOME, NO BRAINER $

Newsgroup: comp.sys.atari.programmer
Date: 1997-07-13 00:00:00 UTC
From: a7@a.a
Message-ID: <33c92278.0@news.unibe.ch>
Source record: 6739

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to work. This

system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

You can get exactly 120Hz (untested (*)) with a divider of 64 and a initial TADR
value of 160 for example (2457600/64 = 38400, 38400/160 = 240), and using
your own counter in the interrupt routine to trigger your event every
2nd interrupt. Give it a try, the values above should be 5 for TACR and
160 for TADR.
If you need extremely precise timings, you could busy-wait, of course...
Just wait for the appropriate number of cycles until the next event while
the interrupts are turned off.

-LJ

Source record: 6597

[hic!] (I'm gonna regret this) ...

```
#include <gem.h>
#include "objc.h"
#define DEF_LIBC_ONLY
#include <libc.h>

static long
slider_lim(ut,uv,up,n)
long ut,
uv,
up,
n;
{long t;

up += n;
up = Max(up,0);
t = ut - uv;
t = Max(t,0);
up = Min(up,t);
return up;
}

static int
slider_pos(unit_tot,unit_vis,unit_off)
long unit_tot,
unit_vis,
unit_off;
{
return 1000 * unit_off / (unit_tot - unit_vis);
}

static int
slider_siz(unit_tot,unit_vis)
long unit_tot,
unit_vis;
{int t =((1000 * unit_vis) / unit_tot);

return (t > 1000) ? 1000 : t;
}

static int
slunit_pos(unit_tot,unit_vis,slider_pos)
long unit_tot,
unit_vis,
slider_pos;
```

```
{
return ((slider_pos + 1) * (unit_tot - unit_vis)) / 1000;
}

long
_ob_slmov(fcp,fcd,ob,slb_obi,slf_obi,vf,ut,uv,up,n)
void (*fcp)();
char *fcd;
OBJECT *ob;
int slb_obi,
slf_obi;
uint vf;
long ut,
uv,
up,
n;
/*[ long slider_mov(fcp,fcd,ob,slb_obi,slf_obi,vf,ut,uv,up,n)
void (*fcp)();
char *fcd;
OBJECT *ob;
int slb_obi,
slf_obi;
uint vf;
long ut,
uv,
up,
n;
```

This call allows easily implementation of slider bars in dialogues.

fcp user defined finction.
fcd user defined pointer.
ob dialogue's object tree.
slb_obi slider background object index.
slf_obi slider foreground object index.
vf flag to control slider orientation and other features.
ut unit total.
uv unit visible.
up unit position.
n number of units by which to increase or decrease.

The slider must contain a parent box (slb_obi) in which lies a single child box (slf_obi). Typically slb_obi is the shaded part and slf_obi the white part of the slider although the colour and shading is entirely irrelevent.

To construct a slider which looks like a normal window slider use an IBOX, place a GBUTTON at either end of this for the two arrows and make then TOUCHEXIT. Cover the remainder of the IBOX with a grey shaded GBOX - this is slb_obi. Now cover slb_obi with a white shaded GBOX - this is slf_obi. Make them both TOUCHEXIT also. The construction should match the aes call graf_slidebox() where slf_obi slides within slb_obi.

```
Mask SL_DIR_HOR into 'vf' if the slider is horizontal otherwise SL_DIR_VER. In
those cases where the user clicks on slf_obi also mask in SL_MOV_BAR - this
causes sl_mov() to invoke graf_slidebox.

'ut' is some value denoting how many elements exist in the data which
corresponds to the window. As an example, if the data were a document then 'ut'
would probably contain the current number of lines.

'uv' denotes how many elements of 'ut' can currently be displayed. This equates
to the current window size. Using the document example again, if 'uv' were 10
then the display would be able to hold 10 lines.

'up' is the current offset, in elements, of the display from the beginning value
of zero. That is, it denotes the portion of the document currently being shown
in the display.

'n' is the number of elements by which to adjust 'up'. Thus, passing -1 would
scroll up a line, passing 'uv' would scroll down a page. Passing zero is valid.

sl_mov() takes all of 'ut','uv','up','n' into account each time it is called.
Thus changes to document size, display size or positioning will be reflected.

'fcp' is ignored if passed as NULL otherwise it should be the address of some
user function. This function is called with (fcd,ut,uv,up) as its arguments.
'fcd' can be anything the user desires - except for passing it to 'fcp' sl_mov
ignores it. 'fcp' is called after calculations have been made but just before
the slider is visually updated. Typically, 'fcp' is the user's function for
updating the display associated with the slider. Note that the 'up' passed to
'fcp' will reflect the calculations made in sl_mov but is always the same as
the return value from sl_mov. 'fcd' is typically a pointer to a user defined
structure to help the 'fcp' function update its display without requiring any
recourse to global variable declarations.
]*/
{long sls,

Mario, thanks for taking the time to help, I really appreciate it. So, pressing on...

Mario wrote:

> IMHO there should be a complete slider object available, but since
> there isn't, it is necessary to to it by hand.

Yeah, and they're complex little gits to code manually..! :)

> Well I can't help with GFA (Basic?) but I can help with the sliders in
> general.

Great

> The problems you are having seem to be mostly related to converting
> the logical 1-1000 scale to the pixel positions onscreen. You can do
> this with this simple formula. It will convert between any two scales:

So the way to do this properly is definitely to stick to the logical scale. Cool, that's one question answered...

So, do you maintain the slider_size and slider_position variables in logical units, and then only do the pixel conversions when the time comes to actually change the slider?

> So to convert your 1-1000 scale to the pixel scale of the slider
> (assuming the slider is 100 pixels high) you could use:
>
> pixel_position = logical_position * 100 / 1000

That "100" that you refer to - is that the size of the slider itself, the size of the slidebar, or the range of freedom of movement that the slider has on the slidebar? (ie the slidebar size minus the slider size)

> Note that the 100 would be better replaced with a way of determining
> the slider height, such as tree[object].ob_height. This way adjusting
> the slider size in the resource would not require a change to the
> program.

Yes, I do this already.

> pixel_position = position_in_document * slider_size / document_size

"position_in_document" I guess is the line number, slider_size (in logical units?). What units is "document_size" in? If the document is (say) 7 lines, does document_size = 7?

I must say I didn't have much luck in getting this formula to work -
however, I did get ProGem's formula (below) to work, but that does not
include the slider size in the formula, which is not ideal, obviously.

pixel_position = 1000 * (top_wind - top_doc) / (total_doc - seen_doc)

> set_slider_position(position , range)
>
> You will want similar functions for setting the size of the slider.

Yes, I do all this. So far, this is the neatest code I've _ever_
written, as it's going to become part of my personal GEM library that
I'm building up.

> In most cases, you will also find it necessary to copy areas of the
> display that are still visible during scrolling, rather than redrawing
> them.

Ah, that's good advice - I don't do that currently because most of the
redraw area is pretty small - 4 or 5 lines or so. But I will certainly
add that to the routines (when I get them working... :)

> I hope this has been of some help. If I can be of further assistance,
> don't hesitate to ask.

Thanks Mario, you've been a great help. Let me have a play and I'll

Much appreciated...

I am looking for the game called Phoenix, I know it was released for the 2600. That version is not the one I am needing. I am looking for a release on either the 800/XL, 5200, 7800, or the ST computer. I remember back in 84-85 reading a review for it, I do not remember what system it was released for. I REALLY need this game, if someone can help me out, I will pay $$$ for it. Please let me know by e-mail. Thank you in advance.

Sincerely,

Steve Flater

(My news server doesn't seem to have received earlier articles in this
thread. From memory you use STOS, which I am not familiar with)

A pseudocode algorithm you could use (Typed entirely from memory) is:

(Ignoring error checking)

```
set_scroller_size:
get window work area
num_lines_displayable = work_area_height / height_of_one_line
num_chars_displayable = work_area_width / width_of_one_char
if num_lines_displayable is less than lines_in_document
display vertical scroll thumb full size
else
new_size = num_lines_displayable / lines_in_document
new_position = top_line / (lines_in_document - num_lines_displayable)
display vertical scroll thumb at new_position with new_size
end if
if num_chars_displayable is less than longest_line
display horizontal scroll thumb full size
else
new_size = num_chars_displayable / longest_line
new_position = offset_in_line / (longest_line - num_chars_displayable)
display horizontal scroll thumb at new_position with new_size
end if
```

(I've ignored clipping and error checks in the following display pseudocode)

```
display_horizontal_scroller:
get horizontal scroll bar position
if scroller is full size
left = 0
right = width_of_scroll_area
else
scroll_width_in_pixels = new_size_percentage * width_of_scroll_area
range = width_of_scroll_area - scroll_width_in_pixels
```

```
left = new_position_percentage * range
right = left + range
end if
top = 0
bottom = height_of_horizontal_scroll_bar
add scrollbar position to (left,top) and (right,bottom)
draw thumb from (left,top) to (right,bottom)

display_vertical_scroller:
get vertical scroll bar position
if scroller is full size
top = 0
bottom = height_of_scroll_area
else
scroll_height_in_pixels = new_size_percentage * height_of_scroll_area
range = height_of_scroll_area - scroll_height_in_pixels
top = new_position_percentage * range
bottom = top + range
end if
left = 0
right = width_of_vertical_scroll_bar
add scrollbar position to (left,top) and (right,bottom)
draw thumb from (left,top) to (right,bottom)
```

(There is probably something obvious I've left out)

(From an infomercial currently playing on New Zealand Television)

"What do our customers tell us about using the Pure Water Distiller?"
"... [The Water] is so easy to drink, compared to other water"

Yeah, I agree. Whenever I want to drink normal water, I have to consult a _really_big_ instruction manual - and even then, it takes me half an hour before I can start to drink, because there aren't any pictures showing me how. But with the Pure Water Distiller, they include a simple one-page leaflet - WITH PICTURES!! - that show me how to drink water...

5549. Detecting DSHD/DSED

Newsgroup: comp.sys.atari.programmer
Date: 1997-07-16 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <33cca8f9.0@comnet.co.nz>
Source record: 6600

How do you detect whether a drive is high density or extra high density?

Once you have ascertained that TOS can handle DSHD or DSED discs/drives, how do you detect which one [DSHD/DSED] is installed?

I've looked in the cookie jar, and when the _SWI cookie exists, and switch 7 is on (bit 6 of the cookie value is 'off'), this is supposed to indicate that an enhanced floppy disc controller is available. How can I tell if it is a DSHD or DSED controller?

However, on some versions of TOS (like 3.05 in the TT in front of me), an _FDC cookie doesn't exist, so I am unable to check its value for the highest drive type supported by hardware.

(After a brief hiatus, I've resumed work on my DESKFMT background disc formatter and copier for MultiTOS and need some way of working out the capability of the hardware I'm running on).

(DSHD = Double Sided High Density aka 1.44 meg discs/drives)
(DSED = Double Sided Extra-high Density aka 2.88 meg discs/drives)

This logic is the wrong way round: replace 'less than' than by 'greater than'.
And similarly for the horizontal case.

Gavin Finnie

From: Abdul Safar <ASE1000@1stfamily.com>
Message-ID: <7137cd$1701.2e3@NEWS>
Source record: 6606

Greetings from 1stfamily,

As we all know unlimited Internet access is $19.95 / month
with every major Internet access company. From Netcom to
AT&T that price never changed. So what makes us any
different when we are also charging $19.95 / month ???

Our Marketing Plan.

Our method is this. Unlimited Internet access for $19.95 per
month. If you find our service to be extremely satisfactory,
in which we are sure you will, you can refer our service
to 10 of your friends and family. If you do , you will get
free Unlimited Internet access with your e-mail address
for life !

What we offer is this:

* The fastest, clearest Internet access in the world.

* World Wide Internet access in over 110 countries.

* An e-mail account that is also life time free if you refer
10 of your friends and family to using our service.

* America On-line for only $10 / month !

* Much much more that will amaze you !

Our plan is by the year 2005 we will be the world's ONLY
Internet service providers. With our technique of offering you
life time free Internet access we will be.

Please visit our web site http://www.freeisp.com/ any where
from the world to know more about our opportunity and to even
get on the wagon before every one else beats you there.

http://www.freeisp.com/

Please forward this message to all of your online friends. Wouldn't you
want all of them to get free Internet access ?

Abdul (SPONSOR ID # SAF5197)
Stop paying for Internet access !

There's no way to know for sure what type of drive is installed. All you
can do is try to format a disk and report an error if there is one. Even
the _FDC cookie in 3.06/2.06 relies on a DIP switch setting. I suppose you
could just check the DIP switch and always go by that.

5561. Abuse Source Code Released

Newsgroup: comp.sys.atari.programmer
Date: 1997-07-22 00:00:00 UTC
From: Dave Taylor <ddt@crack.com>
Message-ID: <33D4FE38.756A@crack.com>
Source record: 6612

Crack released the Abuse source code to the public domain recently.
Abuse was a shareware and retail game released for DOS, MacOS, Linux,
Irix, and AIX platforms.

The source is available at

http://games.3dreview.com/abuse/files/abuse_pd.tgz
and
http://games.3dreview.com/abuse/files/abuse_pd.zip

If you don't know the 1st thing about Abuse,

http://crack.com/games/abuse
and
http://games.3dreview.com/abuse

Lastly, if you want to discuss the source (this is a just-in-case thing-
it may very well not get used), we put a small newsgroup up at

news://addicted.to.crack.com/crack.technical

That is also where we'll prolly host a newsgroup about Golgotha DLL's,
mods, editting, movies and stuff like that later on.

5573. Hardware Scrolling With a Static Area

Newsgroup: comp.sys.atari.programmer
Date: 1997-07-24 00:00:00 UTC
From: mlake@melake.erols.com
Message-ID: <slrn5te41c.ae1.mlake@melake.erols.com>
Source record: 6624

I'm writing a program that is doing hardware scrolling. I want to have a small static area on the screen to keep some status info. The static area can be on the top, or the bottom, or on one of the sides ... though my preferences I think would be 1., bottom, 2. top, and 3. a side.

What are some recommendations of ways to keep a static area? An HBL interrupt? Is there an easy way using hardware scrolling to scroll only a portion of the screen? If so, I don't see how. Any other ideas or recommendations? Some example assembler code would be a great help.

TIA.

5574. Req.Info on Object Status

Newsgroup: comp.sys.atari.programmer
Date: 1997-07-24 00:00:00 UTC
From: mc9931@mclink.it
Message-ID: <5r80et$dfc@news1.mclink.it>
Source record: 6625

What are for bits 8 to 15 of the Object Status Fields that are available under the 'special flags' of Interface RSC Editor? I know that ob_state bits 0-5 are used for object effects (i.e. selected or shadowed), but on various Programming Books (i.e. Compendium) I couldn't find anything on bits 8 thru 15. I have seen around RSCs with interesting effects using special combination of ob_state bits, so I am wondering if it is possible to find around some information on this subject..

>
> Lodovico

```
hi,
in fact only bits 0 to 5 are used by the system in the OB_STATE
whiteback is rarely useful and is intended to force a white background
for certain objects but is very rarely useful !!!!
the draw3d bit is not checked by the system it's only for compatibility
with old german libraries (?)
the 3d effects are stored in OB_FLAGS !! (not ob_state)
bits 9&10 which are called extended flags in 'interface2' ..
%00 means 'no 3d'
%01 means 3d indicator
%10 means 3d background
%11 means 3d activator
3d background is very useful to get 3d objects that have the right
color in color modes and monochrome modes (it won't appear black)
you must have an hollow fill and a white color for background and
then put 3d background bits and it will always have the right color !!
when an outlined object have the 3d background bits set it appears
with a thick 3d border ...
warning:
3d effect can be obtained even with objects without a frame
for example g_text or g_icon because it's independant of
the frame thickness ..
there is a bug with that under Magic Os that forces you to always
have a frame when you want to have 3d effect...shame...

hope this helps,
DAVID

Try this:

```
#include <stdio.h>
#include <ext.h>
#include <tos.h>

void install_joy_handler(void);
void remove_joy_handler(void);
void joy_handler(char*p);

void *old_joyvec; /* old joyvector */
volatile int joy; /* knop status */

int main(void)
{
Supexec((long)install_joy_handler);
do
{
printf("Joycode is: %d\r",joy);
}
while(!kbhit());
getch();
Supexec((long)remove_joy_handler);
return 0;
}

void install_joy_handler(void)
{
KBDVBASE *p;
p=Kbdvbase();
old_joyvec=p->kb_joyvec;
p->kb_joyvec=joy_handler;
}

void remove_joy_handler(void)
{
KBDVBASE *p;
```

```
p=Kbdvbase();
p->kb_joyvec=old_joyvec;
}

void joy_handler(char* p)
{
joy=p[2];
}
```

I think somebody has suggested a good method to implement exactly 120hz.

If you need any more help just ask.

If the "Atari is dead" person has nothing better to do with his or her time, than show their jealousy towards the ATARI devotion. Then he or she should spend some time thinking about how they have bought into the ideology of the PC. Also with all that time on their hands, perhaps he or she are the ones sending all the spam to the atari.st news group.

If you have 4Mo or more on Falcon or TT you can use GCC and for the shell
you can use my graphic shell name GCCShell it work well on most system
especially on multitasking as Magic or Multitos, it's in french but there
is an RSC in english. There is too GNUShell you can find it on ftp.

Orlando,

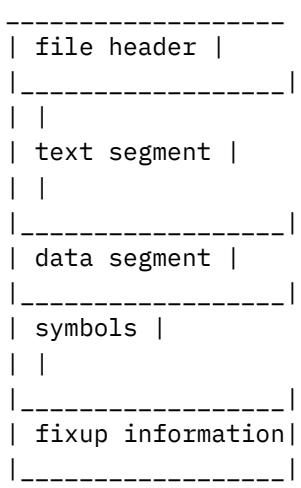
> Does anybody know hwere I can get the specs to Atari's Executable
> files?

Taken from a GEMDOS techincal doc...

JR.

EXECUTABLE FILES
An executable file consists of a header followed by
images for the text and data segments, zero or more symbol
table entries, a fixup offset, and zero or more fixup
records:

Executable File Parts



The file header contains a "magic" number (a signature
to indicate that it is an executable file) and several long-
words containing size information:

Executable File Header

Offset	Size	Description
0x00	word	0x601A (magic number)
0x02	long	Size of text segment
0x06	long	Size of data segment
0x0A	long	Size of BSS segment
0x0E	long	Size of symbol table
0x12	long	(reserved)
0x16	long	(reserved)

0x1A	word	(reserved)
0x1C		(start of text segment)
_____	_____	_____

The text and data segment images immediately follow the header. The symbol table, if there is one, follows the data segment.

GEMDOS will "fix up" a longword in the text or data segments by adding the base of the text segment to the value already in the longword. The fixup list specifies which longwords need to be relocated. The first item in the fixup list is a longword specifying the offset of the first fixup; the longword is NULL (0L) if there are no fixups. Single bytes following the longword specify offsets to more fixups. The longwords must start on word boundaries, or the system will crash.

Relocation Bytes

_____
____Byte____	_____Description_____
0	end of relocation information
1	advance 254 bytes, get next byte
2, 4, .. 254	fixup longword at location pointer
3, 5, .. 255	(odd numbers, reserved for future use)
_____	_____

SYMBOL TABLE
The symbol table consists of symbol-table entries, formatted as:

Symbol Table Entry

_____
| |
| |
| 8 bytes |
| symbol name |
|_____|
| WORD symbol type |
|_____|
| LONG symbol value|
| |
|_____|

<<<explain about symbol types here. It's really pretty simple...>>>
Values for Symbol Types

_____
|____Type____|__Value_|
| defined | 0x8000|

```
| equated | 0x4000|
| global | 0x2000|
| equated register | 0x1000|
| external reference | 0x0800|
| data based relocatable| 0x0400|
| text based relocatable| 0x0200|
| BSS based relocatable | 0x0100|

They are user flags and maybe used to extend GEM, you will of course
have to
write the routines to deal with the extra flags.

Heat & Serve C is probably the best PD offering around. It is CLI
operated
but it shouldn't be a problem. I would recommend the Everest text editor
for
entering your programs.

You were told in an earlier statement in other news groups to sell
your computer (or your wife to be). seems a sensible solution to me,
or you could try hitching a lift - though if Canada is as dangerous a
place as America promotes itself to be, I wouldn't take that option.
Sell your computer

Cross-posted to: alt.comp.shareware.programmer,comp.sys.acorn.programmer,comp.sys.amiga.programmer,comp.sys.atari.programmer,comp.sys.be.programmer,comp.sys.mac.programmer.misc,comp.sys.newton.programmer,comp.sys.next.programmer,comp.unix.programmer

Hi there,

after some time registering that every/some people have a "Tamagochi" I think about writing a "real" virtual Pet Software on the Macintosh and PC. I discussed with my girlfriend this idea and noted some of the specs I want to implement into my App. If you want to add, delete, help or discuss something, I would appreciate it :-)
I can write the Mac and PC Versions but every help and/or support is welcome :-)

Now a draft of the specs and Ideas I have for my virtual Pet APP:

Name: CyberPet or CyberBoz
Systems: Macintosh, Windows, Amiga, Newton
Shareware or Freeware concept.

Basic specs:
One-Window based Application which is the Home of the vPet. The Background Image can be changed to different ambients.
The real basic is that every App is able to interprete a DNA structure which must be defined (see "The DNA format").

1.) There is a Bed, Kittchen, Playground, Office and a Door.
There are some options in the Window you can click on. With this functions you can interact with your vPet. You can play with him, give food, give Books aso. It could be also thinkable that you can buy thinks like Magazines or Food for your vPet. This must be made in a virtual Supermarket - but is another Idea.

2.) Menu "Pet" point named "wants to Travel" (DNA Export)
If you select the Travel Menue in the App the vPet leave through the door and you must select "want to come" to reload it. Is also possible to beam the vPet via Infrared from one Device to another (in the Newton App). From now on you can take this file with you on a Disk or send it via Internet to somebody else - your vPet is Traveling.
My Idea is that the vPet can travel from one App to another App. This should be not limited to one Plattform and work in form of a DNA export structure.
With this option you can take your vPet with you to work or to a friend.
The vPet can visit the vPet from you Friend or Girlfriend.
If a external vPet is visiting your vPet in your App there is a chance that

you get new vPets with a mixed DNA. But there must be a Male and Female vPet and they have to fall in love. Most of this functions and procedures are RND type and you must have luck to get children vPet out :-) Number and sex of these childrens are also RND.

3.) The DNA format
I'm not sure about all the things I want to store inside the DNA. First of all the age of the vPet. I'm also not sure about the source of the first vPet - is there a egg coming with the App like in Creatures or is there only the App and you must find a baby vPet somewhere. (It's also possible that I send you your first DNA by eMail if you are a "good" guy :-)) In addition to the age there is the sex type, height, weight, eyecolor, haircolor, feetsize and some character specs which handle the control of the vPet. It must be like this: If you feed your vPet twice and it decide to eat, it must become bigger and heavier. Next Day it eat more than before RND controlled. So there could be big and small vPet's and many types of children variations. The same with the intelligence: If you buy magazines and books for your vPet it become more intelligent like a other vPet without these gifts ... and so on ... it is as I said, most of these variations are RND controlled and can be extended in future releases. This is also a major spec in the DNA format that it is upgradeable and downcompatible. Here is also the most room for your suggestions and ideas.

I want to have a open discussion about this Idea. Could be great to have all over the World vPets and your vPet can Travel and learn about other cultures. I dont know how to implement this things, but I have many Ideas ..
I need also Help from programmers for the Newton App. I plan to publish the DNA specs free and everyone who wants to write vApps like vHospital, vSupermarkets, vFitness and vSport Apps is welcome :-)
Is also planed that vPets can cary messages for specific vPets (friends) and there is also a possibility to have a vMarketplace somewhere in the Net. This Idea combines the virtual Identity Idea and the Tamagochi Idea. I need general help from graphic freaks and specific help from coders for the Amiga Version.

So, the discussion is opened - hope somebody react positiv on this Idea ?! :-)

Regards ...

Frank

>3) If I move the RSC, (thus the window), do I need to only think about
>the window? or the RSC too with a OBJC_DRAW?
>I mean. is just a wind_set enough? or is OBJC_draw necessary over it?

You do not need to use objc_draw(), just the wind_set().
If a redraw is needed the AES will send a wm_redraw message.
You will however need to update the x,y coordinates of the root object
or else the AES will think the objects are still at their old
positions. Use wind_get() to find the window work area coordinates to
get these.

>4) I have my RSC tree with border outlined 2 point interior, sometimes
>it doesn't redraw correctly the border, If I was using a background
>without border it would be fine.

It would be fine without the border. I have the same problem with
borders though.

>5) I have an object (icon with selected), I would like that when I
>click on it, it woul display it but selected, so far it works fine but
>don't know how to redraw this area only coz the icon. So If I refresh
>teh whole screen it would change state(visually)..

Simple. Find the x,y screen coordinates using objc_offset() then find
the objects width and height and simple restrict the object draw to
this area. You will also need to allow for any border the object has.

I recieved many eMails regarding my Idea. Many thanks for that. Here now
the first update of the Projekt:

Name: CyberPet or CyberBoz
Systems: Macintosh, Windows, Amiga, Newton, Psion?
Shareware or Freeware concept.
Project state: Concept
Project leader: frank.blechschmitt@bluewin.ch

Update 0.1

IF YOU WANT TO HELP IN THIS PROJECT SEND ME A eMAIL! I ADD YOUR NAME IN THE
PROGRAMMERS LIST
AND I WILL CONTACT YOU IF THE DEVELOPMENT STARTS. YOU WILL RECEIVE THE vPET
SDK KIT FREE WITH
ALL INFORMATIONS AND FORMAT DESCRIPTIONS. vPET IS YOUR APPLICATION!

to Basic specs:
I forgott to say that vPet is a game charactered App. Even if there some
functions which points to a economic simulation App it should be a GAME !
But the simulation effect is automaticly coming if the vPet is RND
controlled :-)
More and more i get the impression that this project would be a great game
also for childrens. They can learn how to handle with money, how important
is health and who to find friends and a partner. The vPet can smoke but
then it reduce the health status :-)

to 1.) The possible Playgrounds for the vPet

A idea from Daire Garvey is to have your vPet on your webpage in a Java
applet. Sounds good but then it must make a sence if the vPet is there.
Lets play with the Idea: If you transfer the DNA to a vPet Server there
must be a possible function for the vPet like searching for a partner or
collecting informations. A thinkable way could be to have defined
categories like "Go shopping", "do Sport", "make Hollidays", "search a
partner" etc. Inside this categories the vPet have a order; like "buy
food". If now a other vPet has the needed information or the needed product
your vPet is buying/recieving it and stores it in the order field. If now
the vPet returns to home it puts the food into the refridgerator and

communicate it to you. If the order was to make Holliday and he returns the DNA is modified and the life quality standart is increased or decreased. This adds the question to the project if we need vMoney. How do the vPet pay for Holiday or in the Supermarket ? How do you buy Books for it ? But if we add vMoney we need a vBank, vCreditkard etc ... :-)

We can solve this problem if we have a function implemented that give us the possibility to spend our vPet every Month some pocket money and the vPet stores it in the DNA.pocket_money or put it on a vBank. The DNA.bank_number var is important if your vPet wants to buy something on Credit somewhere. If somebody wants to create a vBank he must register it and receive a bank_number.

But first we must think on the makeable things. I must shrink the possible interactions in the first release because i dont have the time to implement all ideas :-)

to 3.) The vDNA format - VPTP (Virtual Pet Transfer Protocol)

Ok, the vDNA format is now the major interrest. I think that the numbers of variables must
be expandable for future updates. But to limit the size of the possible vars there must be variable field list with a value range header. That means that there must be libraries (vDNS) which hold the value ranges and there description. The vDNA only represent numbers which access the values inside the vDNS. Is like in real life - there are many combinations possible with only 4 values. Every vDNS has a unique Number which is generated by the main App. The unique part is controlled by the user registration which gives various numbers. Every vPet is registered and everybody can check the popullation state in the web.
The registration of your vPet is FREE! Is only to handle the statistics. It could be very interesting to see how many vPets still life and how many are death. If a vPet dies it must be also registered and the name is deleted in the main registry. Btw, it's also thinkable to build vCommunities and vCountries. Functions of these Instances could be to define the life conditions. The life conditions help to handle the DNA.health_state. But this is a future point :-)

Example:
def type format
current_feeling (0,1) as integer
current_actualtime as time (stores the export time if the vPet is going to travel)
age_birthdate as date
height_cm as byte
weight_kg as byte
sex_type as bolean (true=male, false=female)
health_state (0,1) as integer
eye_color as byte
hair_color as byte
feet_size as byte
pocket_money

```
bank_number
...
character_specs as ??? (still thinking about this point)
...
end type

dim vDNA as type format

Settings:
vDNA.current_feeling(0,0) = 1 rem first position of the value range of the
feeling DNS which can be from -10 to 10.
vDNA.current_feeling(0,1) = 5 rem the 5 is the used value

The benefit of this methode is:
If we want to extend the possible combinations we can expand the value
range inside the DNS library 1.

3.1) NEW - The vDNS format

The vDNS Library format is a list of value ranges and their format. The
vDNS is handled by the main App and is not transfered. Only a way to update
the vDNS must be there.

Example:
def type format
description as string * 30
range (1) as integer
end type

dim vDNS (x) as format

vDNS.description = "Feeling state"
vDNS.range(0) = -10
vDNS.range(1) = 10

Something like this should give us a max. of variations. I'm not sure if we
should use the description only as description or also as a identifier for
a interpreter. I mean, if a other Version of the DNS Library has a other
value range in position 1 it must be possible to search inside the field
for the Feeling state.

5.) NEW - Project Programmers:

Hanan Y Jacob (wants to help writing JAVA applets) 06.08.1997
```

> 1) I need to have a window behind any RSC tree I want to display.
> Otherwise in multitasking, it won't be recognized. Normal?

You can use the following method instead of a window (though a window is
better):

```
wind_update(BEG_UPDATE);
wind_update(BEG_MCTRL);
form_dial(FMD_START...);
objc_draw(...);
form_do(...);
```

Then, when you're done handling form_do() results...

```
wind_update(END_MCTRL);
wind_update(END_UPDATE);
form_dial(FMD_FINISH...);
```

> 2) Is the LASTOB flag really necessary?

Yes. Atari's AES requires it when dealing with EDITABLE objects. If you
leave it out, some versions of the AES will crash when you press Tab while
the edit cursor is on the last editable object in the tree. Most resource
editors handle the setting of this flag for you automatically.

I have released a Pure C/Lattice C source library to replace
form_do() etc. with windowed versions. I believe you can download
it from Rick Teitjen's web page - teleport.com/~atari or something
like that.

(Unfortunately, I used the same name as a similar Sorbozon C source
library, so giving you the filename would probably cause confusion.)

Amiga is dead and Psion is something I heard of only once.

Since you do not seem to consider including Unix/X Window System
platforms, could you please take your thread out of
comp.unix.programmer?

Thank you. [followups set appropriately]

I think it would be a good (better?) idea to mimic real life and make the "DNA" part only store the characteristics and instincts of the creature, not stuff like age, etc which is a parameter of the individual body that the DNA resides in. As well as allowing the pet itself to travel, why not facilitate the meeting between two pets to produce offspring with a combination of the parent's DNA. If you also allow for DNA "mutation" (i.e. random copying errors) then you'll have the basis for natural selection to take place. The selection will work automatically by the appeal of the vPet to a particular user- "nice" vPets will tend to succeed where "nasty" or useless ones won't. After a time the vpets will take on a life of their own and "evolve" in unexpected and astonishing directions. Obviously to do this the basic protocols for turning the DNA into a body (phenotype) need to be established and based on very simple rules. The first vPets may be rather unsophisticated and perhaps virus-like, but eventually more interesting ones will arise.

Go to it!

Atari XL is an 8-bit system!!! It is based on 6502 processor... Similair
to this used in Commodore 64. There're still quite a lot ppl who code
demos on it (especially in Poland). One week ago there was an Atari
party in Poland (called: Orneta'97 or QuaST'97 party) where 7 demos &
15 intros was shown for competition. Those demos included effects like:
- phong shading (two big toruses at once on screen)
- Z-buffering (four Z-buffered pyramids (tetraherdons?))
- real time fractal zoom
- texture mapping on cube
- bump mapping
- gouraud shading on cude
... and so on... if you need more informations about this system, then
post email to: ataripl@piwo.bl.pg.gda.pl (Polish Atari discussion list)

Is there any way to implement background events with out using
wf_bevent and wind_set()?

My attempts to do this do not seem to work. If an object is clicked
on then it is selected but everything freezes until the mouse button
is released (ie not doing the graf_watchbox which is supposed to be
called after the initial click and hold)
I presume this is something to do with the AES sending wm_topped as
the problem does not occur with right clicks.

David

Whereas the ST is a 16-bit machine based around the 68000 processor the
same as the Amiga and early Macs...

(the original poster may not have been aware of this...)

Anthony

KNOWLEDGE IS POWER. It separates the WINNERS from the LOSERS.
Do you want to be a winner? Do you know what separates the very successful
people from the people just getting by? INFORMATION!!! The MOST
successful people in any field, don't have all the answers... BUT they do
know where to find them. Everyone needs to have information. Children
need it for school, and good grades. Adults need it to keep informed and
current with associates. Don't you know someone that always seems to be
on the inside track? They may have already bought this report. Have ALL the
information you need at your finger tips. I already spent hundreds of hours
searching the internet to find the sites you need, with links to thousands of other sites.

Here are a few examples: government sites, local and federal. Are you trying
to find someone that owes you money? Do you need to check someone's
background... potential employee, tennant, anyone. Find that lost love or
college buddy. Lookup phone numbers around the block or around the world.
Track down court records. Check someones credit, educational background,
driving or criminal record. Locate military records. Get all the newest games,
try them before you buy them. Find dozens of free offers. Search libraries around
the world.

Just about anything you can imagine , can be found on the internet. You just
have to know WHERE to look.

Don't wait... your competitors aren't waiting for you!!!

You don't need graf_watchbox.

> I presume this is something to do with the AES sending wm_topped as
> the problem does not occur with right clicks.
>

It would do if you enabled both buttons. Once you've enabled background
events that window will *not* received WM_TOPPED messages. What you get
instead, is MU_BUTTON messages. Ideally, you want to be using evnt_multi
because it also writes the current mouse co-ordinates which you will
need because then you call objc_find to obtain the object index in the
tree.

The fastest way to really get Pure Pascal (my experience) is either sending money (risky) to their address or buying Pure Pascal during some Atari exhibition.

These programmms add features of NVDI (Enhancer) and MagiC (Wdialog) to other TOS systems. That means that programms using off screen bitmaps (NVDI-like) or the MagiC file selector (e.g.) can run on other systems as well. They don't speed up anything. They don't give you the full functionality. They just add what is most sufficient to use programs needing those extensions.

Some programms can test if they are there and then use them (CAB e.g. uses off schreen bitmaps to display animated giffs without flickering. without enhancer (or NVDI) these will flicker). Others won't run without them (well they also test if the extension is there, but break if this is not the case). An example for these is GEMJIG. It uses WDIALOG (don't ask me what for).

I don't think they need a special order in the auto folder. I load WDIALOG from the GEM.CNF (Multitos; still had no money to upgrade to N.AES); Enhancer I don't need since I have NVDI.

AFAIK Enhancer just adds off schreen bitmaps to the VDI. No speed up; No GDOS (this means no printer drivers and no vector fonts, etc.). I think it is better to get NVDI (it is really not expensive for what you get from it). WDIALOG doesn't install all MagiC AES extensions, but enough for me to get the programms running. An example is I think the scrollable edit fields. ASH told me that Jieene uses them if they are there and WDIALOG does not implement them. But in most cases it should be sufficient.

A list of programms where I am shure they can at least use the extensions:

- CAB
- GEMJIG
- TEXEL
- ARTWORKS
- PHOENIX
- PAPPILION
- JIEENE
- There was some fontselector implementing the font protokoll using the MagiC fontselector.

Of course there are more, but I am not shure about them.

Christof

OK, Nick!

I tested this .prg, both versions 2.4 & 2.5, but nothing from this
doesn't wonted to work on my Mega4/STe with TOS 2.05 (?!).
I plugged in 8 or may be (don't remember!) 10 (!) mauses from deference
manufacturers to all serial ports (from Modem1 to Serial2), but no one
maus doesn't worked out too.

If your experiments will be more successfully, please, report me about.

At last time, and why coul'd you been to try to reconstructing standard
PC-maus?

Good hunting on mauses!

Source record: 6584

Hey everyone,

I'm currently writting a program in GFA BASIC 3.5E. I'm using
medium resolution. When tinkering witht the colors, I can't seem to
figure out how they work(What each index coorsponds to).

Example:

SETCOLOR 0,0,0,0 Sets the border to black
SETCOLOR 1,0,0,0 What does this control (TEXT/PRINT/GRAPHICS?)
SETCOLOR 2,0,0,0 What does this control (TEXT/PRINT/GRAPHICS?)
SETCOLOR 3,0,0,0 This is suppose to control the color of PRINTed text
correct? Such as SETCOLOR 3,0,0,7 would display
PRINT "should be blue" in BLUE CORRECT?

What's better to use VSETCOLOR or SETCOLOR?

Also anyone know how to print text on the border? Is it possible?

Scott.

Errr, the Printer Dialog is only a part of the WDialog system.

It is a Window system for putting dialogs into windows, the good part
with this one is that,if you have 2 programs that uses it, you only need
1 Wdialog in memory (unlike for example the E-Gem Libraries)

From: rojewski@primenet.com
Message-ID: <5t1q70$m16@nntp02.primenet.com>
Source record: 6590

I'm working with WDIALOG and having no luck with it calling the event handler routine specified in wdlg_create().

So I get a window, but no events posted when I call wdlg_event().

I have re-created the wdlg interface routines with Lattice C instead of the Pure C they were originally written in. It could be a translation problem, or maybe I'm just not understanding the concept.

The docs say the the handler will be called when create (HNDL_INIT) and open (HNDL_OPEN) are called, but I have a fprintf in the routine and it never shows up.

Any ideas?

Sorry, I was interrupted numerous times whilst replying and totally lost track. I meant to be more specific.

What I meant was, you don't need graf_watchbox as long as you don't mind clicking on an object and having it selected immediately - that is, no going back. Anyway ...

I wrote my own form_do for pug yonks ago and I also had problems with graf_watchbox (and graf_mkstate for that matter). My own solution was to write a replacement watchbox routine.

However, along with the compendium came two hitherto undocumented functions - form_keybd and form_button. Both are used internally by form_do. I suspect form_button will do the job.

I believe you should be significantly more specific about what you want
to do here. The term 'background events' can be understood in several ways
causing confusion which I believe has happened here.

>> >> My attempts to do this do not seem to work. If an object is
>> clicked
>> >> on then it is selected but everything freezes until the mouse
>> button
>> >> is released (ie not doing the graf_watchbox which is supposed to be
>>

You really should post the piece of code here that gives you trouble, with
a detailed description what you want to achieve. graf_watchbox works well,
but must be used in the right way.

>> >You don't need graf_watchbox.
>>
>> You do when its part of your own replacement form_do()

Very unlikely. I suspect you've tried to simulate form_button's behaviour
with graf_watchbox, which doesn't work all too well. Normally, for a
form_do replacement you'd need little more than form_button, form_keybd,
objc_find and objc_edit (plus event_multi in some way of course).

> However, along with the compendium came two hitherto undocumented
> functions - form_keybd and form_button. Both are used internally by

No. Both have been documented since early beginning of the Atari ST series.
Here I have the tenth edition of the Profibuch from 1991, and even the first
edition (must have been 87 or so) had the documentation.

>> >because it also writes the current mouse co-ordinates which you will
>> >need because then you call objc_find to obtain the object index in
>> the

>> >tree.
>>
>> And my form_do uses evnt_multi :-)

It's not possible to do a real form_do replacement without event_multi,
as even for the most basic implementation at least MU_KEYBD and MU_BUTTON
must be watched.

Cheers Peter

> SETCOLOR 2,0,0,0 What does this control (TEXT/PRINT/GRAPHICS?)

I don't have GFA but I would imagine the index maps directly onto the TOS call of the same name. If this is the case then its probably easiest to initially describe it in terms of the standard Gem desktop.

setcolor 0 is "desktop white" (pen 0)
setcolor 1 is "desktop red" (pen 1)
setcolor 2 is "desktop green" (pen 2)
setcolor 3 is "desktop black" (pen 3)

For any program, pen 0 is always used for the background colour when drawing. This includes text because in reality text chars are just graphic shapes which get copied to the screen. More on this later.

For GEM, "desktop black" is the foreground colour used when drawing. This is pen number 1 in monochrome, pen 3 in medium rez and pen 15 for low rez.

> SETCOLOR 3,0,0,0 This is suppose to control the color of PRINTed text
>
> correct? Such as SETCOLOR 3,0,0,7 would display
> PRINT "should be blue" in BLUE CORRECT?

Yes and no. At the risk of boring you I'll go through it from scratch.

When the hardware wants to draw the screen in medium rez it sees the screen as a load of pixels each of which has been drawn using one of the four pens. As it comes to each pixel it looks what pen was used to draw it then looks up what colour that pen actually is. This happens at least 50 times a second so the moment you change pen 3 from black to blue, *all* the stuff drawn with pen 3 turns blue. If this is what you want then fine. Usually it aint!

If you want to keep the previous black text and have blue text as well
you choose a pen which is not being used. You can't use pen 0, or pen 3
so it'll have to be pen 1 or 2 - it doesn't matter which but lets say
it's pen 2. Just change the pen 2 colour to blue then print the text
using pen 2 instead of the default pen 3.

No doubt there's a GFA command to do this but even if there isn't you
can use the VT52 console driver to do it.

[esc][b][pen + space] (foreground pen)
[esc][c][pen + space] (background pen)

My basic is lousy but it should go something like this ...

```
PRINT "this is black"

SETCOLOR 2,0,0,7
PRINT CHR$(27);"b";CHR$(2 + 32);
PRINT "blue if I've not mucked up the semicolons on the print!"

PRINT CHR$(27);"c";CHR$(3 + 32);
PRINT "blue on black"

PRINT CHR$(27);"b";CHR$(3 + 32);
PRINT CHR$(27);"c";CHR$(0 + 32);
PRINT "black on white again"
```

You may have noticed I said initially that the background is always pen
0 so how come [esc][c] is possible. Well, its just an example of
(confusing) relative terminology. It's the background colour for text
but the text background colour is not tied to the real background
colour. The console just uses foreground colour [esc][c] as the text
background.

> What's better to use VSETCOLOR or SETCOLOR?
>

Naturally, I haven't a clue!

> Also anyone know how to print text on the border? Is it possible?
>

Nope & iirc yes, but very hard - interrupts and stuff methinks.

Yeh but I think its better to be able to go back just incase the
button was clicked on by accident and IMO it is better to allow this.

>I wrote my own form_do for pug yonks ago and I also had problems with
>graf_watchbox (and graf_mkstate for that matter). My own solution was to

I maybe wasn't very clear with this so:

1) When the window with the button in is the topped window everything,
including graf_watchbox works fine.

2) If the window is not topped then it locks up until the mouse button
is released so by the time that the graf_watchbox is reached the
mouse button is no longer held down so it just 'flows' straight
through it.
My original question was to do with clicks on untopped windows
inquiring whether or not it was possible to recognise these clicks
without the AES blocking until the mouse button was released due to
the AES sending wm_topped.

I don't know if that makes sense to anyone but its the best way I can
think of to describe what is happening.

>However, along with the compendium came two hitherto undocumented
>functions - form_keybd and form_button. Both are used internally by
>form_do. I suspect form_button will do the job.

Actually My very sparse AES docs that came with 'Introducing Atari ST
Machine Code' contains both these functions.

By 'background events' I mean exactly what using wind_set and
wf_bevent allow, being able to interact with buttons/sliders etc even
though they are not in the currently topped window.

>Very unlikely. I suspect you've tried to simulate form_button's behaviour
>with graf_watchbox, which doesn't work all too well. Normally, for a
>form_do replacement you'd need little more than form_button, form_keybd,
>objc_find and objc_edit (plus event_multi in some way of course).

No I've not done that, as I stated originally my problem arises if the
window is not the currently topped one.
The problem with graf_watchbox arose from my attempt to perform
'background events' if the window was not the top one.
The AES blocks until the mouse button is released (something to do
with it sending wm_topped I believe) so that when the graf_watchbox is
reached the program just continues as the mouse button is no longer
held down.

I would post my code except it is part of a general purpose main
program loop due to the way I have implemented non-modal dialogs.
As I'm programming in ASM this code is several 1000 lines long.

I can't remember which is which, but I think that one of them sets STe colours correctly, i.e. from 0-15, while the other one sets it as it is in the hardware, with the LSB at the highest position.

hello

can anybody help me with a urgend problem please?

I have a program that i am porting to PC. But there is a file, that
i cant read correctly on the pc. The program was written in pascal, and
I only must read this file and write the contents to a textfile.

I would send the source of the binary file, and the sourcecode to convert
the file on the atari.
The file is a binary file which is opended as file of real (atari pascal)
.

please mail me back, if you could help me.

with best regards
hermann.

Unfortunately, this was not the case with most generally available
english documentation. To be fair, there is mention of them in Compute's
AES book but ...

The wording leaves you wondering if the functions even exist under any
particular gem.

There are no examples.

You are told the binding will not exist in your compiler and you need to
add it yourself in assembler with not even a vague hint how this is
accomplished.

c'est la vie! ;-)

When background events are enabled you have to click on the window's menubar to top the window (and you will get WM_TOPPED). Clicking elsewhere in the window will return you the MU_BUTTON event and you will not receive WM_TOPPED. If you are receiving it still then background events are not enabled.

> I don't know if that makes sense to anyone but its the best way I can
> think of to describe what is happening.
>

If memory serves, there's another problem when the background object is partially obscured by another window on top of it - graf_watchbox draws the whole object not just the parts of the object which are visible under the window on top. You need to call your redraw routine so that it gets selected and unselected properly so the window on top does not get drawn over.

I would have expected magic to do this automatically but it didn't. If it can do it, then I somehow stopped it. Comments from anybody who knows please?

Ahaaa, this is what you mean. Well, here you just have bad luck. This is
the philosophy of GEM. A window in the background won't see ANY mouse action,
it only gets a TOPPED message when someone clicks into it. Of course the
message isn't send before the user releases the mouse button; per definitionem
an action under GEM is initiated when the button is *released*. It is all the
same with clicking buttons, window closer or fuller, menu entries etc. Later
people invented the BEVENT attribute, but you seem to not like it, as you wrote
in your original message :

> Is there any way to implement background events with out using
> wf_bevent and wind_set()?

I can only recommend to use BEVENT for this ! If it conflicts with something
else you wanna do, then it's bad luck, it won't work in any other way (well,
at least not in a multitasking friendly manner - you can always use wind_update
(BEG_MCTRL) and do all the mouse stuff by yourself).

What is it for ?

1) Several modern AES let you operate the sliders of non-topped windows
anyway !

2) If the window manager in your AES doesn't do it, then there is nothing
an application can do about it in any sensible way. The only solution
would be replacing significant parts of the AES.

If you talk about interaction with objects in the working area of a non-
topped window (objects you must redraw yourself in your application), then
of course the AES won't do that. But then WF_BEVENT is precisely what you
need !

> I would post my code except it is part of a general purpose main
> program loop due to the way I have implemented non-modal dialogs.

Note non-modal dialogs does NOT mean they must be operable even if their
window is in the background ! It is usually the better solution to just
let them alone if in the background, and require the user to top them if
he wants to play with them.

Cheers Peter

> >
and so on...

I think that the question is a "double question". If you want to let thinks running in background, that's one question. If you want to detect action on button located in forms which are inside untopped windows, that's another question.
Let start with the first one:
Each time you call an AES function, the AES take the hand. It just take a look at all other GEM applications (eg ACC) and give them the hand. That means that you call Rsrc_Gaddr() so you jump into this function, but the AES exit from Evn_Multi() previously called by an ACC (for exampl). The ACC calls Form_Keyboard() and the AES exit from you Rsrc_Gaddr(). So, you run if other applications also call AES. That's called "cooperative multitasking", because if my ACC go into a pure ASM loop, it don't call anymore the AES and my APP don't have the "hand".
In old TOS, some functions were "stopping function". In fact, calling an alert box in an ACC stopped the other GEM APP. It's not yet true actually with TOS 4. You can try that: build a short ACC with a small evnt_Timer() and each 2 seconds, print A, then B, then C.... on the top left corner of the screen, using Gemdos and VT52. You'll see the printing occuring even if an APP open an alert box.
So, to let background running, you don't have to do special think.

The second question is about clicking on untopped windows. It depend also on AES version, specially for double clicking. It work perfectly on a FALCON but not on a ST: you don't get double clic but lonely clic or no click at all. You can perfom that, using Evnt_Multi with a click detection: while a click is detected, ask Wind_Find() to get the Handle of the clicked window. Dont' forget to check handle 0 (the background of the screen). If it's your window, perform an Obj_Find() to get the object number. Then perform a Form_Button() to let the AES driving correctly radio button. If you want to use slider, or editable field,

don't forget to use the clipping. The best way to perform editable field
is to enter a classical form_do function, and set the editable field as
a exit/default button, from which the user will exit using RETURN.
Note: just after your evnt_multi() call you check the kind of evnt that
happened: if you don't want the window to be topped, you just have to
peform first the clic, then the message and just forget the message.

I hope this will light your lantern.

regards

>that's another question.

If you read the original post you would have seen that I mentioned
wind_set() using wf_bevent, which is how to enable clicking on objects
in untopped windows with the correct AES version of course. The
original question was could this be simulated without using the
wind_set call.
I may not have made this clear though.

The part about graf_watchbox arose from the effect my attempt to
simulate the wind_set effect caused:

1) click on object in untopped window
2) object selects and redraws
3) system freezes until mouse button released: even if mouse moved
outside of the object it does not deselect, as it should as
graf_watchbox is suposed to be called.

I was only trying to describe what was happening here, not saying that
graf_watchbox wasn't working.

>no click at all. You can perfom that, using Evnt_Multi with a click
>detection: while a click is detected, ask Wind_Find() to get the Handle

>the screen). If it's your window, perform an Obj_Find() to get the
>object number. Then perform a Form_Button() to let the AES driving
>correctly radio button.

Yes I do all of that (except using form_button, I just check the
object flags to identify what to do with the object and act upon it
with my own code)

>happened: if you don't want the window to be topped, you just have to
>peform first the clic, then the message and just forget the message.

Yes but the system freezes until the click is released and as such the
call to graf_watchbox just 'flows' through as the button is no longer
held down. Unless wind_set has been called using wf_bevent, in which
case the problem does not arise as the AES does not bother to send the
wm_topped and so the system does not freeze.

I don't know why the system freezes until the click is released as all the AES is doing is sending the wm_topped message to my program.

I have now been experimenting and it doesn't matter what I attempt to do after the click has been registered it does not perform until the button is released, this is despite calling evnt_multi with the number of clicks to $103, the button to click as 3 and the button state as $103.

5661. Setcolor/vsetcolor fill problem (AGAIN!!!)

Newsgroup: comp.sys.atari.programmer
Date: 1997-08-20 00:00:00 UTC
From: Scott Harris <harris@cs.mun.ca>
Message-ID: <Pine.SUN.3.95q.970820154239.25706C-100000@ganymede.cs.mun.ca>
Source record: 6512

```
Hello everybody,

I thought I had this SETCOLOR/VSETCOLOR problem figured out,
thanks to the many replies I recieved from the loyal atari
programmers/posters here. However, everything was working fine until I
filled the screen with the ARECT command in GFA BASIC 3.5E. Heres the
code I'm using....

' *** my standard-colors for Medium resolution
'
VSETCOLOR 0,0,0,0 !Background (BLACK)
VSETCOLOR 1,9,9,9 !Printed Text (WHITE)
VSETCOLOR 2,0,9,0 !Other Text color (GREEN)
VSETCOLOR 3,2,0,5 !Fill Colors (DEEP BLUE)
black=0
white=1 !Set the appropriate color numbers
green=2 !with the appropriate color varible
blue=3

These are the only colors I'll bee using in my program. Blue for
boxes/screen fills white and green for text, and black for background
(border).

When displaying a filled box on the screen such as PBOX x1,y1,x2,y2 and
using the DEFFILL blue,2,5, the colors are fine. The box comes out blue.
on a black background.

Now the problem. In another procedure I use the ARECT command to fill the
screen. This eliminates the closed box lines when using PBOX. However,
the colors do not work proper as withthe PBOX, DEFFILL command. Here's
the procedure...

PROCEDURE fill_screen
CLS !Clears the screen
GRAPHMODE 0 !Replace mode
pattern%=&X10001000100010 !My pattern for the fill (Anyone
know how to do this better?)
z%=V:pattern% !Find the patterns address
ACLIP 1,0,0,scrn.x.max,scrn.y.max !Clip the screen
ARECT 0,0,scrn.x.max,scrn.y.max,blue,0,z%,1 !Fill the screen in BLUE
ACLIP 0,0,0,scrn.x.max,scrn.y.max !Clip it again
END !END because I don't move on unitl
I've solved the problem
RETURN
```

The problem is, The screen gets filled with the pattern, but in white, not blue!, Whats the problem? I've defined the color to be blue, so why does the computer assume white?

Please help? Also if anyone has a better routine of doing this and wouldn't mind sharing, I'd be more than happy to accept :)

Scott.

Another possibility would be to use one thing AES has offered from the
first version to the latest: You can operate in background windows when
you hold the right mouse button pressed. That means, to select an item in
a background window, hold down the right button and then click onto the
left one.

There's nothing special to be done for this to work, a usual evnt_multi()
loop which waits for left-button-presses will do. After receiving a click
event, simply call wind_find() to get the handle of the window the click
was directed to.

This method may be a bit inconvenient for the user, but has the advantage
that it works with all AESes, whereas WF_BEVENT is a new window option
which is not present in AES < 3.30 (unless you are using WINX).

Ciao

Thomas

I'm not certian on this, but it may work. There is a shareware program for atari called MARCEL. This word processor can save text/docs in many formats, RTF, First word plus e.t.c. Perhaps you could download a copy of this program and load your file into it. You can then save it in the format required by MS Word. I know it works for word perfiect to wordplus and vesa-versa. I'm not sure of the format MS Word uses to save its docs.

Hope this helps,

Scott.

Yeh but its so much nicer not to have to top the window (and quicker
as well)

The Marcel word processor can read 1st word files and will save in
RTF.

5667. VFAT.XFS for MiNT??

Newsgroup: comp.sys.atari.programmer
Date: 1997-08-21 00:00:00 UTC
From: q-funk@citenet.net
Message-ID: <5tgb7g$t5a$1@cti01.citenet.net>
Source record: 6518

Given that I often have to exchange data with customers on Win95,
I was looking for a VFAT.XFS so I could be 100% compatible.

http://www-plateau.cs.berkeley.edu/people/chaffee/vfat.html

Seems to indicate that VFAT has been the default filesystem running
in Linux since quite a while, so I was wondering if there is anyone
competent enough to extract the VFAT routines and create a VFAT.XFS
that could run neatly along MINIX.XFS so that VFAT partitions could
be read/written when needed.

I know very well that MINIX is a *much* better filesystem than VFAT,
but compatibility is a key issue here. I make WebPages for a living
and often receive logos and images, on ZiP/Jaz or Floppies formatted
on VFAT under Win95, so I need to access the longnames, as truncated
names aren't good enough.

Additionally, Win95 cannot read/write Minix-formatted floppy or ZiP,
so to answer an obvious question, no, Minix isn't good enough. Also,
please avoid any replies mentionning Magic; it just isn't compatible
with MiNT and MiNTnet, so switching to Magic is out of the question.

Could anyone look into porting the Linux sources?

Thanks! ;-)

From: oskancke@online.no
Message-ID: <5thq72qap1@o.online.no>
Source record: 6520

hello, I'm currently working on a textviewer and have got a problem.
Now, this is the case; I use evnt_multi to wait for a keypress
(evnt_keybd()), and when I get that event and have detemined that the
pressed key is an arrow down (scancode $50 or $48, don't remember) I enter
my scroll down routine. Now, when this scroll down routine is finished
(one line scrolled), I want to check, somehow, to see if that key is still
pressed! This way I can loop this scrolling routine which speeds up the
scrolling quite much and avoid the keyboard overrun. I've tried to use
Bconin(), Cconis() and have messed with the iorec buffer for the keyboard,
but haven't managed to do it right. So, I would like to know if there's a
legal way of checking if the last key received from the keyboard ACIA was
a "make" or a "break" key. Kinda like checking if the mousebuttons are
still down by calling graf_mkstate(). Can anyone shed some light on this
subject?

This is wrong. The default filesystem in Linux is *ext2*. VFAT is only
the default *FAT* filesystem, but who wants to use a dog slow filesystem
anyway?

I wouldn't worry too much about that. (obviously ...) The worst is
that BEVENT isn't implemented and the window will be topped first.
Also, lower screen resolutions usually dictate that the window be
topped to see what's going on in any case. ;-)

> FOR z%=1 TO 10
> items%(x%,y%,z%)=x%*y%+z%
> NEXT z%
> NEXT y%
> NEXT x%

An array such as this does not hold 30 pieces of data (as I believe Scott
is looking for), but holds 10*10*10 (=1000) pieces of data.

explanation:

dim items%(10)
- creates an 1D array of 10 values.

dim items%(10,10)
- creates an 2D table of items 10 by 10 square - ie 10 columns and 10 rows

dim items%(10,10,10)
- creates a 3D cuboid table of data - 10 columns, 10 rows, and 10 deep

> FOR i%=1 TO 10
> PRINT items%(i%,i%,i%)
> NEXT i%

This little loop will of course only print a small number of the values stored
in this array - the diagonal line through the cube starting at 1,1,1 and ending
at 10,10,10. To extract the full data needs nested for loops as above.

If you only want to store 3 values for 10 items, then the easiest way
to do this
is a simple 2D array:

dim items%(10,3)

To access value 1 for item 5 use: item%(5,1)
- so to set the value, use item%(5,1)=45
```

- or to use it in something else: x% = 34 * item%(5,1)
To access value 2 for item 5 use: item%(5,2)
To access value 3 for item 5 use: item%(5,3)
To access value 1 for item 6 use: item%(6,1)
etc...

BTW. I dont know GFA at all, so I've just used the same syntax as Uwe...
(many languages start array indicies at 0, but I believe GFA defaults to 1)

Hope this helps...

Anthony

Yes, this is a good way, but one is beter : using the keyboard
equivalence table fonction. You will find it with the name of :
Keytbl()

If your aim is to watch for menu shortcut, please look directly in
the ressource menu, so when you change it, it steel works. So you can
translate shortcut as well...
Good luck !

>An array such as this does not hold 30 pieces of data (as I believe Scott
>is looking for), but holds 10*10*10 (=1000) pieces of data.
```

Ups, my failure.

```
>> FOR i%=1 TO 10
>> PRINT items%(i%,i%,i%)
>> NEXT i%
>
>This little loop will of course only print a small number of the values stored
>in this array - the diagonal line through the cube starting at 1,1,1 and ending
>at 10,10,10. To extract the full data needs nested for loops as above.
```

Correct. It's just a simple test for me, I've not used GFA for 3 years.
The output of these 3 lines shows me, that all was functioning as aspected.

```
>BTW. I dont know GFA at all, so I've just used the same syntax as Uwe...
>(many languages start array indicies at 0, but I believe GFA defaults to 1)
```

You can set the start index using

OPTION BASE <value>

with value = 0 or 1

This will set/change the start index for all arrays in the hole program.

BTW: The extension % of all variables in my listing stands for 4 long int.

Other types are:
! boolean (1 byte)
| signed byte (1 byte)
& signed word (2 byte)
% signed long (4 byte)
# float (8 byte) This is the default type!
$ String (up to 32767 byte)

So a!, a|, a&, a%, a# (or just a) and a$ are 6 different variables!

Greetings,
Uwe.

Strange. If you want to display a box, the best way is to draw it under
a RSC editor so to have this box as a form. After that under your RSC
editor, you put a string in this form and that's all.

Regards
```

5688. Reverse imaging text in a window

Newsgroup: comp.sys.atari.programmer
Date: 1997-08-28 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <95329909_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 6539

Sometime ago I asked the following question:

If I have a window with lines of text in it, how do I reverse image a particular line as in an editor when you drag the mouse to copy a block.

Someone kindly posted some example code and I think it was to do with vro_cpyfm(?).

Now that I have time to try it, I have lost the relevant articles, due to a crash sometime ago :(

Could someone please tell me how I can do this?

TIA,
Gary

I believe that a lot of the CIS stuff exists at UMICH and also on the
PoolDisk that was produced by Ernest and Bo Schreurs in The Netherlands
about two years ago, but I also see that William Kendrick replied to
your message, so I'm going to look at this reply before commenting
further on UMICH.

Yep that's the one. I figured it out after. I realized all I need was to find the amount of space between to two coordinates, and use that to find the center for the text. Thanks anyhow. However there's another one I've been working on. My program will be reading alot of files. Some of these may get quite lengthy. I want to put a status box on the screen which displays the amount of file read wiht a bar (PBOX). How do I go about converting that.

Eg.

Say I have a file of 9000 bytes, the status bar has 400 pixels and is centered on the screen in a box. How do I go about making the status bar move, or grow according to the amount of data read in, so it ends on the 400th pixel accurately. Such as the the ones displayed when formating disks and stuff. I know how to make the growing bar, but notso its accurate with the file being read in. Math was never my strong point. Once division was introduced in elementary school, the world became a very confusing place :)

Scott.

5694. STFM & memory above the 4 MByte limit.

Newsgroup: comp.sys.atari.programmer
Date: 1997-08-29 00:00:00 UTC
From: pls@no.spam
Message-ID: <5u6124$71e@bcrkh13.bnr.ca>
Source record: 6542
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

I am posting this to the two groups as it's relevant to both.

I modified a 1/2 MByte STFM to 4 Megs using a 8 MByte 72 pin SIMM.
This works because the 8 MByte SIMM has the same number of address lines as the STFM MMU. It has two more RAS lines, but I just tied these 'high'.

So now I had a 4 MByte STFM & it works really well. I find it's more reliable than my Marpet Xtra ram board

I wondered if there was some way to use the upper 4 MBytes on the SIMM.
I wanted to use the STFM's MMU to access it because it seemed the easiest way (less wiring on the motherboard & it's cheaper).

AFAIK, there is no hardware in the STFM with the address range $400000 to $C000000. Read/writes to this area cause bus errors, generated by the GLUE chip. It's fairly easy to decode all or some of this range, so I decoded an extra 4 MBytes.

Because the ST's MMU only has 2 RAS lines, I expanded these with some more logic & the address decoder to generate a total of 4 RAS lines. It seems possible to generate more, i.e.. 8 MBytes also looks do-able, but all I want right now is the extra 4 MBytes.

So, I built this into the STFM & I can now access memory from $400000 through $7FFFFF. This only works because the memory bank configuration for the 'lower' 4 MBytes is the same as the 'upper' 4 MBytes. In reality, the MMU only really knows about the 'lower' 4 MBytes.

I still have some hardware bugs to iron out, but right away I see some other OS related problems.

I am using TOS 1.04, & it does not appear to like memory above the 4 MByte limit. It sets PHYSTOP to less than 4 MBytes, around 3.2 MBytes.

This may be a consequence of failing the ST's memory test, where $400000 is supposed to be the first unreadable location . I have manually reset this to $400000 & also set the ramtop to $3F8000. When I do the memory test, all 4 MBytes are found.

I have tried a few programs to see if they would detect this extra memory.

Sysinfo finds it , it reports $800000 of ST memory. I though that any memory above $400000 was called TT ram. Sysinfo complains that ST RAM is invalid because it's too high. Sysinfo finds 0 TT RAM.

Memtest also finds the extra memory, it also reports 8 MBytes of ST memory.

Manually setting the ramtop is not really good enough, as the OS still won't use it, so how do you reset all required memory structures so that the extra memory is found? I don't know how to fix this right now.

Also, the screen memory is still set below the 4 MByte limit, the MMU is not able to directly address the 'upper' 4 MBytes. I may be able to fix this later, but I could live with the screen set between $3F8000 & $$00000, as long as the OS can handle two large pools of memory.

I have not tried MiNT, but I was told that MiNT may be able to detect & use this memory right away. Is this true?

AFAIK, TOS 2.06 may be able to address this memory, I remember the Marpet expansion board board (8 MByte extra) needed TOS 2.06.

Has anybody else done anything like this?

Hey, that's bl**dy clever of you, Gerry. You must write it up so that
others can have a go.

>Because the ST's MMU only has 2 RAS lines, I expanded these with some more
>logic & the address decoder to generate a total of 4 RAS lines. It seems

I did something like this myself using a circuit by ????? (forget
now). The purpose of this was to be able to use an extra memory bank
so that you ended up with a "3Mb ST" (many people found they had a
spare memory board after swapping early 512Kb expansions for later 2Mb
ones) - ong story.

I couldn't get it to work on my STM as the circuit introduced a delay
which was just too long to be accommodated by the 120ns chips.

>AFAIK, TOS 2.06 may be able to address this memory, I remember the Marpet
>expansion board board (8 MByte extra) needed TOS 2.06.
>
>Has anybody else done anything like this?

Yes, this could be a worry. A lot of intimate software could well be
coded on the 4Mb assumption. Not that it was wrong to make this
assumption - you just have to count the address lines. They just
didn't reckon on a crafty bu**er like you to extend the address space.

I see that AiXit are selling RAM extensions over 4Mb. I think this
should give you some confidence as they wouldn't be doing this if it
meant using totally new OS. Why not ask them how they do it?

Is this a recent copy of their data? I know umich (?) has a bunch of stuff
from CIS but I know they don't have everything. I remember their being tons
of stuff more when I last used CIS in the 80's. When the new version of 1030
Express came out. In fact, there should be a program of mine up there that
converts version 2 to version 3 phone files.

If you want some help I could lend some time to it. I'm not sure how you
want to do it though. A large tar ball of some stuff would work for me.
(Guess I should get the Unix Atari emulator up and running...)

6.3-named files, if you can believe it.

5703. Problem with gdb?

Newsgroup: comp.sys.atari.programmer
Date: 1997-08-31 00:00:00 UTC
From: john@JCordes.Phys.Dal.Ca
Message-ID: <5uaiuv$5n2$1@News.Dal.Ca>
Source record: 6454

I'm having a lot of trouble trying to get the GNU debugger (gdb) to work. Some help would be greatly appreciated! See below for a description of the problem.

Thanks,
John

==========

System:
AtariST (Mega STE, 4MB Ram, TOS 2.05). I'm not using MiNT or MultiTOS or ..., just plain old single tasking TOS.

Followed instructions in gcc-st.txt (dated 1992), by Frank Ridderbusch; using gulam (with appropriate environment variables set).

```
$ gcc -c -g hello.c
$ gcc -o hello.tos hello.o -lgnu
$ sym-ld -o hello.sym d:\gnu\lib\crt0.o hello.o -lgnu
```

('sym-ld -ohello.sym $GNULIB\crt0.o hello.o -lgnu' also works)

```
$ gdb
(gdb) exec-file hello.tos
(gdb) symbol-file hello.sym
```

gdb produces the message:

```
" Reading symbol data from d:/gnu/gnushell/examples\hello.sym...
Ranged type doesn't fit within known sizes. On an atariST this is
most likely due to objects compiled with the "-mshort" option to
gcc. Please re-try by specifying the "-mshort" option on the gdb
command line.
n2 == -559939584, n3 == -1389945743 "
```

==========

I've tried using 'gdb -mshort' but the same message results. I've also recompiled with 'gcc -mshort' and linked with -lgnu16; again, the same problem arises. Have also tried using gcrt0.o instead of crt0.o.

==========

Version numbers:
gcc Version 2.5.8 Pl 1
sym-ld Pl 36 (Jul 1/93)
gdb 2.6 Pl 18

==========

hello.c is:

```
#include <stdio.h>
main()
{
printf("Hello world\n");
}
================================
```

> proportion = 3000 / 9000 = 0.33333333
> width_to_draw = 400 * 0.33333333 = 133.333332 (round to int = 133).

> You will notice that 133 pixels is a third of a 400 pixel bar. :)

Personally, I'd calculate it a little different:

width_to_draw = (amount_read * max_width) / total_size

which mimics the inline Lattice C code

width_to_draw = umul_div( amount_read, max_width, total_size )

This can all be done in integer arithmetic, leaving out any floating point
math which is _much_ slower (even with an FPU) which your algorithm seems
to require.

With my algorithm and your example data (assuming the range is 0..32767)
; d0 d1 d2
move.w amount_read,d0 ; 3000 <undef> <undef>
move.w max_width,d1 ; 3000 400 <undef>
move.w total_size,d2 ; 3000 400 9000
mulu.w d1,d0 ; 1200000 400 9000
divu.w d2,d0 ; 133 400 9000
move.w d0,width_to_draw ; 133 400 9000

Whereas your algorithm would need either an FPU or a floating point
library (using your algorithm with integer arithmetic would make your bar
either zero [lines zero through 8999] or full size at line 9000)

With an FPU ; fp0 fp1 fp2
; FPU will perform int-to-float and float-to-int conversions internally
fmove.w amount_read,fp0 ; 3000.0 <undef> <undef>
fmove.w total_size,fp1 ; 3000.0 9000.0 <undef>
fmove.w max_width,fp2 ; 3000.0 9000.0 400.0
fdiv.x fp1,fp0 ; 0.3333 9000.0 400.0
fmul.x fp2,fp0 ; 133.33 9000.0 400.0
```

```
fmove.w fp0,width_to_draw ; 133.33 9000.0 400.0
; FPU sets "INEX" inexact flag during round-to-int while processing
; fmove to memory (133.33 -> 133 is inexact ["data is lost"])
```

Without an FPU (Assume all float math is in 64-bit doubles)

```
; Assume all float math is done in 64-bit doubles.
; Operands are placed in _fop1, _fop2 as required
; Results are returned in _fres
; except for float_to_word which returns in d0
; and word_to_float which returns in d0/d1
move.w amount_read,d0 ; pass param to convert in d0
jsr _word_to_float ; convert it
movem.l d0/d1,_fop1 ; move double to float math operand 1
move.w total_size,d0 ; pass param to convert in d0
jsr _word_to_float ; convert it
movem.l d0/d1,_fop2 ; move double to float math operand 2
jsr _fmul ; multiply operand 1 and two
movem.l _fres,d0/d1 ; get double result
movem.l d0/d1,_fop1 ; move result to operand 1 for divide
move.w max_width,d0 ; pass param to convert in d0
jsr _word_to_float ; convert it
movem.l d0/d1,_fop2 ; move double to float math operand 2
jsr _fdiv ; divide operand two into operand 1
movem.l _fres,d0/d1 ; get double result
movem.l d0/d1,_fop1 ; move result to operand 1 for integer convert
jsr float_to_word ; convert operand 1 to 16 bit integer
move.w d0,width_to_draw ; store 16-bit value in memory
```

I don't recall which language you are using, so I hope what I've just spent about half-an-hour writing was helpful.

For screen memory not a lot has to be done. Clear the contents of the source and destination memory form structures (FDB structures in MWC compiler) and use the exclusive-or (or NOT destination) writing mode. Set the source and destination co-ordinates to the same values.

Sorry, I've no code for this atm. :-(

Maddalt() exists from gemdos 0.19 and in (later at least) MagiC
versions. It's used to add memory areas not recognised by the BIOS.
For programs to use this, either their alternative ram load bit should
be set, or Mxalloc() should be used. [see compendium, section 2.81]

: Hello.

: I'm about to get a BASIC language, and I think that GFA 3.6 is a
: good choice but I ear of some problems running it on a Falcon. Any advice
: on this subjet?

I have heard that GFA 3.6 does work well with Falcon from someone who is programming with v3.6 on a Falcon. GFA 3.6 is designed for working with the TT. GFA 3.0 and 3.5e were designed with the ST in mind, v3.5e has some nice extras for the STe models.

There are of course other versions of BASIC...

STOS - Game creator BASIC, good for game and multimedia authoring, athough is powerful enough for creating other types of applications. Language can be extended by adding or writting extensions. Machine langage programs can also easily be incoporated to speed up time crittical operations. The biggest downside to STOS is it does't truly use GEM, although there is now an extension called GEMMA to add a GEM like interface to STOS applications.

Hisoft BASIC, although I've never programmed in this particular version of BASIC, I've read reviews, and listened to programmers who write in it. They say it's as good as GFA BASIC, some users say it's better (natural bias). :-)

GFA BASIC is nice, I write with v3.6 on my 4meg TOS 1.02 STFM, so I can't say I've got direct experience working with it on a Falcon. Good editor, fast interpreter, and a compiler. Also comes with a Resource Construction Set.

There are also a bunch of somewhat forgotten BASICs like Fast, or True BASIC, and of course the much loathed ST BASIC.

: Is this language still being supported?.

Hisoft BASIC should still be supported. If your worried about support from the manufacturers and distributers then maybe that's the version of BASIC you would want.

Times running out... TTYL...

OK, OK ... something convinced me to grab the files before
they vanish, so I now have all the files from section 11 and
12 of the CI$ ATARICOMPUTING forum, though I have to kludge them
together into one place (section 11 was grabbed with Qmodem at work,
while section 12 was grabbed with Tapcis, a much smarter CI$ aware program).
I will have to write a parsing program to split out the file descriptions
into the individual description for each file that Tapcis does to get them
consistant, but that shouldn't be too much trouble. 1800 files in section 12,
I haven't yet looked into the section 11 stuff yet.

Yes, this is equaly valid (it is, after all a simple substitution of
proportion in my equations) - I was doing it in that order to hopefully
make it a little clearer were it came from...

> This can all be done in integer arithmetic, leaving out any floating point
> math which is _much_ slower (even with an FPU) which your algorithm seems
> to require.

Yes, that is true, although with big files (>10 meg) with a bar of 400 pixels
you could reach the limit of integer sizes...

> I don't recall which language you are using, so I hope what I've just
> spent about half-an-hour writing was helpful.

The original poster was using GFA, IIRC... (although I use Lattice/asm)
Interesting info though. :)

> what if file size < box size ?

no problems :)

file size=9, done=3, box size=40.

proportion = 3 / 9 = 0.33333333
width_to_draw = 40 * 0.33333333 = 13.3333332 (round to int = 13).

5711. What would you like fast searches of?

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-01 00:00:00 UTC
From: Scott Harris <harris@cs.mun.ca>
Message-ID: <Pine.SUN.3.95q.970901004123.26186A-100000@ganymede.cs.mun.ca>
Source record: 6462

Hello,

If you were using a data base program, what would you like to have fast searches of? Such as Last name, phone number, E-Mail, e.t.c. In other words what would you like to have stored in memory, so when searching for a particular person, phone number, you don't have to wait for file reads and stuff.

Also anyone know how to check and see if a file is a proper file to be used with ones program. My program brings about a file selector. The user can then select the particular file to load. IF the user chooses a different file, than the type intended, how do I tell? I'm currently using the MOD command to test the file length. If a remainder is returned than its not the file my program uses. This is not very efficent though, because a user can select a file which has the same record/field setup as mine.

Eg..

```
OPEN "R",1,file$,30
size=LOF(#1)
test=size MOD 30
IF test<>0
wrong.file!=TRUE
ELSE
wrong.file!=FALSE
ENDIF
```

What if the file they selected is divisble by 30? My program loads it and then mucks up all the array stuff.

Who would want to do something like that anyhow :)

Scott,

Sorry to butt in Tony, but you're over emphasizing the file-selector
here. :) GEMMA allows access to all of GEM - there are various demo
programs making use of windows and dialogues etc. There are commands
implemented for all AES and VDI calls (even AES 4.x).

BTW. GEMMA is still a beta version...

I would certainly recommend HiSoft BASIC.

The IDE is, IMHO, much better than that of GFA BASIC, and a commandline version of the compiler is supplied also, so that you are not tied into the supplied IDE in any case.

HiSoft BASIC is supplied with libraries covering all of the BIOS, GEMDOS, VDI and AES, unlike GFA BASIC where what functions are included are often implemented in a nonstandard manner, but where many functions are not included at all.

HiSoft BASIC is fairly similar to other standard BASICs, which can be useful if you want to use the software on various different versions of BASIC, on different platforms for example.

I could go on, but I think you get the picture. If you have any specific queries you can contact me. I have used GFA BASIC, HiSoft BASIC and STOS I would recommend HiSoft BASIC over all of those.

I have heard that Omikron BASIC is very good, however, so you may want to look into this.

I got a bare-bones 520ST about a year ago, with one boot floppy, no manuals and no HD. Due to the scarcity of help and software, I'm on the verge of selling the system. Can anybody provide me with:

* The most modern OS that will work well on a 520ST. Remember, I don't have a hard drive!

* A decent terminal program so I can get the ST on the net (Zmodem download would be needed).

* Manuals? Any old pro out there who no longer needs to refer to their 520 ST manuals? Even photocopies are welcome.

* Pin-outs and or manual for the color SC1224 Atari monitor.

* Music software for a MIDI keyboard (this is why I got an ST).

Thanks,
Jill

You could put some identifying header on the file that would not be
present in other files. This way, to read in the file you would read the
header, and if the header indicated that the file was in the correct
format, for the correct version of the software etc., you would continue
loading the file. Otherwise, an alert could be displayed informing the
user that the file is not the right type, version etc.

Somewhere in the distant past I used to play around with an ST....I upgraded it to
1 meg and added a hard drive.....Somewhere I reckon I still have lots of
source code....and probably some games.....I dumped the hard drive (sorry) but
I should have some magazines (ATARi User etc...) I will look them out.

I am in Scotland UK. Tell me where you want the stuff sent (I'll pay postage if it doesn't
cost an arm and a leg).

The ASCII code should be in the lower eight bit of the scancode returned
by evnt_multi(). I'm not sure though, as the Atari Compendium isn't clear
about this. The SHIFT/ALT/CONTROL state is also returned by evnt_multi().

> There are four different keyboards avalible for atari computers. German,
> English, USA, and French. You can determine which keyboard is attached

What about Norwegian or Swedish keyboards? Or PC/Mac keyboards? Dvorak?
The keytable can be modified to any keyboard imaginable, so the correct
way to check for keypresses should be the ASCII-value, with shift-status
checked separately if necessary.

I have an STFM with TOS 1.04

Using two different 'sysinfo-like' programs, I get conflicting GEMDOS numbers.

One program reports GEMDOS @ version 0.15, the other at version 0.21.

Does anybody know which is correct for TOS 1.04?

Also, is the Atari Compendium still on sale ?

Btw, I heard that Caldera (the current copyright owners of Digital Research's stuff) have allowed the source code for GEM to be placed on a web site.

There is also something called CP\M 68K.

Am I correct in assuming this is the ancestor of the Atari OS?

Source record: 6477
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hi guys

I posed this question a few months ago when I got my ZIP drive and never really got an answer.

I am running a Falcon with MagiC 5.11 (also used to be 5.03) and HD Driver 6.0, and MagXDesk.

I have a ZIP drive attached to the SCSI port.

If I boot my Falcon and there is no disk in the ZIP drive then I can't access it at all even when I put a disk in. I have to reboot. All I get is a gemdos error (can't remember which one, something like invalid drive).

If I have a disk in the drive with say 3 partitions, and then eject it and insert a disk with one partition, and try to access it, I get the same gemdos error as above. :(

Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?

Seems very poor to me. If it is a bug, would it be possible to write a workaround (ie something that flushes the disk details and does a mediach)?

But surely the Falcon should recognise the disk has changed (or been inserted) and adapt to suit it?

Gary

It depends which way you look at the number. Another posting in this thread points out that the function which returns the GEMDOS version gives 0x1500. If you treat the upper byte as binary coded decimal, you get version 0.15; if you treat it as hexadecimal, you get version 0.21 (1*16+5=21). I remember reading somewhere about this, and the article/posting said that even Atari was inconsistent in which way to treat the version number.

They only differ in the interpretation of the number. The value that
GEMDOS returns is 0x0015, but 15 hexadecimal is 21 decimal. Both are more
or less correct.

Amazing isn't it? That an entire platform's files fits into a ZIP disk....

Is this the A8 files only, or 16bit too? Is this every file uploaded to CIS _ever_, or do they remove old files after some time?

> I would really like to get a single file or three to simplify
> and speed backing up.

Perhaps I can help? I have a ZIPper on my Mac that I find to be much more reliable than the ones on the PC, notably on large files like this.

I'm using OPENW 0 in my GFA BASIC program. When trying to enable thte cursor ~XBIOS(21,1,0) it does not appear at the coordinated I locate it at. Such LOCATE 20,5 and then ~XBIOS(21,1,0) the cursor appears in tthe upper left most part of the screen and refuses to move. WHY? Does OPENW 0 effect not allow cursor to be active in it. I know all GET x,y,x,y,screen$ commands y co-oordinates have to be increased by 19, because of menu bar area. What about the cursor. Also how do I get the cursor to blink?

Sounds suspiciously like the system thinks the media is fixed. It
wouldn't surprise me at all if you got the same message off your main
hd then discovered the cable had come loose!

>Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?

Unfortunately I haven't a clue but finding out what HD driver thinks
it is would be the place to start. Assuming that it works ok under TOS
would imply the next place to look would be MagiC then finally
MagxDesk.

>Seems very poor to me. If it is a bug, would it be possible to write a
>workaround (ie something that flushes the disk details and does a mediach)?

I would *guess* that a simple mediach should do the job if it's going
to work at all because of the below ...

I remember yonks ago using Sysmon or something on the filing system
and saw my gasteiner driver was making oodles of pointless mediach
calls to my (fixed) hd. Except, they wouldn't be pointless if the
driver couldn't tell the difference between fixed and removable media
but still wanted to support removable media?

So give Mediach a whirl and see!

>But surely the Falcon should recognise the disk has changed (or been
>inserted) and adapt to suit it?

Dunno. I just discovered my Zip will not eject manually under NT. This
of course could be because I've done something wrong, more probably
BG! On the other hand it could be because there is no way for NT to
find out atm. NT does know the media is removable because it will
software eject. Perhaps something similar is going on in your case -
no hardware sensing (easily answered by someone) or no software
looking at it?

Oh - does hitting ESC on a window open on the zip's root dir have any
effect? Bit kludgy but better than nowt!

I don't know about the newest version of HD driver because Toad Computers retained my original 4.? version and never sent me the upgrade, but the version I have will not relog the drives without rebooting the computer. That means if a removable media is not active when the computer is booted it cannot be accessed without rebooting.

I had hoped that Uwe would fix that by adding an option to relog the hard disks to a CPX as ICD software does. Sounds like he hasn't done that yet. My version of HD driver does correctly deal with media changes if my Syquest drive was ready at bootup.

Geneva hasn't been tested, but I dont see any reason why not. Due to some
dirty memory handling code in STOS (which is gradually being replaced),
there are potential problems under any multitasking system, so I wouldn't
care to say if it works... but it might.

Currently the release versions of GEMMA are interpreter only - so compiled
programs cannot (ATM) access GEM under single or multitasking systems.

BTW. GEMMA has a homepage at: http://www.users.zetnet.co.uk/pjones/

I'm using an STE with TOS 1.62 and HD Driver 6.0

> I have a ZIP drive attached to the SCSI port.

I have a SyQuest EZ-135 on the DMA port, using Gasteiners host adapter.

> If I boot my Falcon and there is no disk in the ZIP drive then I can't
> access it at all even when I put a disk in. I have to reboot. All I get is a
> gemdos error (can't remember which one, something like invalid drive).

I can access the '135 if I manually load HD Driver.

> If I have a disk in the drive with say 3 partitions, and then eject it and
> insert a disk with one partition, and try to access it, I get the same
> gemdos error as above. :(

It could be that you've not set the sector size large enough and the new
disc has sectors larger than the minimum. I have a similar problem when I
change '135 discs where the partition sizes are different. This is
especially true when the first partition is of a very different size.
Usually when a disc is changed, I open drive C:s window and then have to do
a reboot.

> Is this normal behaviour, or is it a bug in MagiC, MagxDesk, or HD Driver?

Since I have a similar problem under TOS, it would appear to be something to
do with HD Driver.

> Seems very poor to me. If it is a bug, would it be possible to write a
> workaround (ie something that flushes the disk details and does a mediach)?

I think it would need to completely read the partitioning information from
the discs and reset it's tables again.

Did, done .. single Pkzip file .. 24 megs or so. Pkzip bombed on my
system (choked perhaps) possibly due to my own system memory constrants,
but the file was there deleted, so I undeleted it and it looks valid
(passes the Pkzip -t).

>all keyboards? How can I use Keytbl() to check for CTRL-A?

Not at all. I use the following piece of shit code in Kivi QWK
to get the stuff done (I'll add some explanation later):

void key_select(struct _key key)
{
struct keytab {
unsigned char *unshift;
unsigned char *shift;
unsigned char *capslock;
} *ktab;
short o=-1;

ktab=(struct keytab *)Keytbl((char *)-1,(char *)-1,(char *)-1);
key.ascii = ktab->unshift[key.scan];
if ((kstate & K_CTRL) && (kstate & (K_LSHIFT|K_RSHIFT))) {
switch(key.ascii) {
case 'w':
case 'g':
}
else if((kstate & K_ALT) && (kstate & (K_LSHIFT|K_RSHIFT))) {
switch(key.ascii) {
case 'r':
o=MENU_REPLYTO;
case 'e':
}
}
else if (kstate & (K_LSHIFT|K_RSHIFT)) {
switch(key.scan) {
case 75: /* nuoli vasemmalle */
case 77: /* sama oikealle */
}
```

```
}
else if (kstate & K_CTRL) {
switch(key.scan) {
case 115:
case 75: /* nuoli vasemmalle */
case 116:
case 77: /* sama oikealle */
default:
switch(key.ascii) {
case 'o':
case 'p':
case 'q': /* quit */
case 'w':
}
}
}
else if (kstate & K_ALT) {
switch (key.scan) {
case 120:
case 122:
default:
switch(key.ascii) {
case 'k':
case 'e':
case 'p':
}
}
}
}
```

As you can see I have removed much code, but you can see the basic frame. The parameter for the function is just the same keycode you get from the evnt_multi (was it ascii in first 8 bits and scan code in the upper part if I remember correctly). The kstate is also the value from evnt_multi.
Then I just use the Ktabl function to get the addresses of the tables and use the address to get the reliable ascii code from the scan code.

It should be pretty straight forward. If you have any question about that code, ask.

Oh yeah... the numeric codes there. For some keys there just isn't reliable ascii code, so I used scan codes to detect them. Keys like that are arrow keys, undo, help etc.

I've to say that the limit of the number of window is a LEGEND !
Only the LAME desktop limits it's number of window. But it is
desktop's fault, and NOT AES's.
Try to open 256 windows, I'm almost sure it will work (I've never
tried).

Don't be silly ;-) We all try to be very helpful, and there is plenty of
software on the net!

> * The most modern OS that will work well on a 520ST. Remember, I don't
> have a hard drive!

Remember, the OS is in ROM, so upgrading TOS means replacing the ROM
chips. The latest version that will work on your ST is 2.06. There are
upgrade boards available that allow you to switch between the original
TOS and the new one, which is useful for compatibility with older games.

Without a HD, and with only 512K of RAM, I would forget about MagiC,
Geneva, Mint, etc... which are modern multitasking systems.

>
> * A decent terminal program so I can get the ST on the net (Zmodem
> download would be needed).

There are several ZModem capable terminal programs (I'm not a
specialist, but take a look at a few FTP sites), TCP/IP PPP and SLIP
connection is now available with STinG, Web browsing can be done with
CAB (you'll need at least a meg though), Usenet and email and FTP can be
done with Newsie... There is other stuff too.

>
> * Manuals? Any old pro out there who no longer needs to refer to their
> 520 ST manuals? Even photocopies are welcome.

The manuals won't tell you more than how to copy a file, format a disk
and save the desktop. I'm sure you can figure that sort of stuff on your
own. There's a chapter about that in the Quick FAQ (see below).

>
> * Pin-outs and or manual for the color SC1224 Atari monitor.

Pinouts can be found here:

http://www.teleport.com/~atari/STinternals.htm#MONITORPORT

>
> * Music software for a MIDI keyboard (this is why I got an ST).
>

Just like on other platforms, the best ones are commercial, Cubase,
Notator, Logic... you often see people selling second hand copies on
this group.

Otherwise, Alchemie or Sweet Sixteen are shareware seqencers that can be
found on the net. I don't have the exact addresses, but they can be
found.

> Thanks,
> Jill

I suggest you take a serious look at my Quick FAQ (the address is in my
.sig). The ST can probably fulfill most of your needs. Don't give up!

The folowing lines does what you want to do. I'm sory if you don't
understand assembly language... but I hate C !!! To slow and unexpressive
(just have a look a PureC bindings and you will see what I mean...).

clr.l d7 ; We take the scan code returned by
move.b int_out+10,d7 ; evnt_multi() : the highest byte of int_ou+10 (int_out[5] in C).

Keytbl #-1,#-1,#-1 ; Let's find the ascii table coresponding to the
move.l d0,a0 ; scan code (UPPER CASE)

move.l 4(a0),a0
add.l d7,a0
move.b (a0),ascii_key

Have a try...

I have a SyQuest 270MB removable drive on my TT with HDDriver, and
sometimes I do observe similar problems. Usually, however, swapping
cartridges "on-the-fly" works fine.

Occasionally, after I swap a cartridge, it appears as though no files are
present on the cartridge. Rebooting brings everything back to normal. I
have never figured out quite why this is.

In any case: remember to set the number of partitions to reserve
appropriately, and remember to set the sector size in the HDDriver setup
so that it is at least as large as the largest you will be using.

Hopefully this would help solve the problem.

Nostrodamus phrophesised this from gary@the-gap.demon.co.uk to All...

Hi Gary!

g> Organization: Home of POPwatch, CoSTa and XURL

g> If I boot my Falcon and there is no disk in the ZIP drive then I
g> can't access it at all even when I put a disk in. I have to reboot. All
g> I get is a gemdos error (can't remember which one, something like
g> invalid drive).

I have a similar problem with my ST (but with a Syquest EZ135 drive)

Try running the mediachange.prg on the HDDriver master disk.

I'd also recommend that you take this to comp.sys.atari.st as Uwe Seimet is a
regular there and is likely to suggest a few things to try.

Speak to 'ya later!

I always found it much easier just to check the ASCII code and keyboard
shift state separately.

This is not only easier, but also ensures compatibility with any keyboard
layout.

Is there some reason why this is an undesirable method?

>or less correct.

That's exactly the problem, if somebody writes code to check the GEMDOS
version, look what can happen.

Prog #1 checks version of GEMDOS, gets 0.15.
Program quits because it needs functions included since GEMDOS 0.19.

Prog#2 checks (same) version of GEMDOS, gets 0.21.
Program then crashes because functions it needs are not present.

I am now fairly sure that I have version 0.15 & that the version should be
called 0.15, because the 'Maddalt' function is included in GEMDOS 0.19 (&
upwards) & I don't have this function.

The HEX number is the correct one. I.e. 0x1500 should be interpreted ad
0.15, 0x2100 is 0.21... If a sysinfo program returns the decimal value
it's simply wrong and misleading.

> Prog#2 checks (same) version of GEMDOS, gets 0.21.
> Program then crashes because functions it needs are not present.

It also crashes because it doesn't use Sversion correctly. All official
docs clearly states how the returned value should be interpreted.

Btw. I don't think 0.21 really exists, according to the Atari Compendium
the actual versions are 0.13 (1.00, 1.02), 0.15 (1.04, 1.06), 0.17
(1.062), 0.19 (2.0x, 3.0x, this is where alternative memory was
introduced) and 0.30 (4.0x, MultiTOS).

> I am now fairly sure that I have version 0.15 & that the version should be

I had a quick look at the MiNT-sources (1.14.3), and it looks like it only
supports Maddalt() if the original GEMDOS does. So it looks like you have
to either fit 2.06 or buy MagiC...

I guess that the AES has a limit, especially since WinX increases the limit to 40 windows, even under 4.04. According to the Atari Compendium the limit was raised from seven (Only 4 under 1.00 and 1.02) to infinite (memory permitting :-) in MultiTOS, a.k.a AES 4.0. This suggests that TOS 4.04 is limited to seven windows.

Does this mean that MiNT + AES 4.1 support alternate memory, even if the
underlying TOS does not?

Does AES 4.1 replace all of TOS , or only the AES portion?

>I had a quick look at the MiNT-sources (1.14.3), and it looks like it only
>supports Maddalt() if the original GEMDOS does. So it looks like you have

I was reading the Compute! TOS book & found a BIOS function called 'Getmpb'
(get Memory Parameter Block).

This is used by GEMDOS to initalise the memory management.

If you use this function, it returns three pointers to memory descriptors.

I looked at the structures & it seems that it should be possible to hook into
these, although the book warns about changing these after initalisation.

There is also a location ($49E is TOS 1.04) which appears to be a pointer to
another mpb. This is currently set to NULL. Would it be possible to create
another mpb & put the address here, then link to the main mpb?

See below.

> Does AES 4.1 replace all of TOS , or only the AES portion?

AES 4.1 is strictly speaking a standard, not a program. But the GEM.SYS 4.1 that's floating around is just a new AES that runs on top of MiNT.

> >I had a quick look at the MiNT-sources (1.14.3), and it looks like it only

MPB doesn't make any sense under MagiC or MiNT, so if you use it it will probably break under anything but plain TOS and perhaps Geneva.

> I looked at the structures & it seems that it should be possible to hook into
> these, although the book warns about changing these after initalisation.

And MiNT (and MagiC I believe) uses a completely different way of organizing memory, so it won't work unless you use plain TOS.

> There is also a location ($49E is TOS 1.04) which appears to be a pointer to
> another mpb. This is currently set to NULL. Would it be possible to create
> another mpb & put the address here, then link to the main mpb?

Haven't got a clue, but as a general rule you should not mess around with MPB. It's highly version-dependant and won't work at all under several OS'es. Upgrade to 2.06 or get MagiC! Unless you play a lot of old games I'd go for the 2.06-options, as it gives you more freedom than MagiC (E.g. you could use the alt. memory under MiNT and TOS as well.).

If you wanna be really evil you can get a TOS image for TOS 2.06 off one of
the Atari Game sites, which is sort of illegalish. But anyway, you could
then load that TOS from disk on bootup and end up with a newer TOS and more
memory minus the size of the TOS image. May be worth a try?

Not true. There *is* a limit of 7 windows total (the desktop is always "open", and it's #8) in all AES versions prior to the one included with the Falcon and MultiTOS. Trying to use wind_create() to create anything past 7 will result in an error code.

The lame desktop in older versions of the AES did have a ridiculously low limit: 4, even though the AES was capable of opening 7. This was prior to 2.x/3.x, IIRC.

5760. GFA Number format conversion query in sample files

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-08 00:00:00 UTC
From: Ben Hall <cb170@city.ac.uk>
Message-ID: <Pine.GSO.3.95.970908222841.17019D-100000@exeter>
Source record: 6411

Hi guys,

I need to be able to extract the sample rate from *.AIF format sample files, but the number is stored in the file in 80-bit IEEE floating point format, and I need to be able to convert this into a readable number.

GFA supports "double" values which are 8-byte IEEE floating point format, but this doesn't seem to help much, either.

So, any clues?

Here's some examples, with the 10 bytes of the IEEE format number, and some sample rates to which they represent:

8K = 64,11,252,160,0,0,0,0,0,1
16k = 64,12,252,160,0,0,0,0,0,1
22k = 64,13,171,108,0,0,0,0,0,1
32k = 64,13,244, 36,0,0,0,0,0,1
44k = 64,14,171,109,0,0,0,0,0,1
48k = 64,14,184,157,0,0,0,0,0,1

So, how can I interpret those 10 bytes into the corresponding sample rate with GFA?

Hi Uwe & Everybody

Today, due to my colour booting problem (another thread) and various unexplained crashes under MagiC, I zeroed my boot partition and reloaded HDDriver, NVDI, MagiC etc.

My ZIP drive seems to be behaving better now. So problem solved for now :) It certainly seems to recognise a disk now, even if I boot without one in the drive. I haven't checked the other problem (swapping from a 1 partition disk to a 3 partition disk and vice versa). If it's still a problem, then of course I'll repost in here :)

Regards,
Gary

This part of the compendium has a couple of typos - I cannot find the
corrections file atm, but I know that TOS 1.00 also had a max of 7 windows.
I also seem to remember that they said that they corrected it to say that
it was AES 3.3 that changed the limit, but I'm not certain on this point...

Most of the good MIDI stuff needs 1 meg to run. Also you need the SM124
mono monitor for most of them. Chances are the TOS in your 520 is the
dreaded 1.0, and that the floppy drive is only single sided.

best of luck with it.

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS
to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.
PKZIP should just get a error from MS-DOS and exit.And PKZIP (2.04g) uses XMS
memory.(and EMS,but nobody uses that anymore)

How much MS-DOS and XMS memory do you have?

Shame on you. Forcing your son to use a 1040 with TOS 1.0:).
I "loaned" my Mighty Sonic Falcon to my 14 yearold with the hope that he is
able to pick-up Calamus and Papyrus. Everytime I go into the room, he has
some game fired-up......He has done some work with M.A.G.E., but only with
sprites so far. Wait until the book reports are due:). Last year I got him
going with PageStream, but I was hoping he could teach me how to use those
fancy ones:).

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS
to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.

And if the requested amount of memory is not available then the OS will say so.
And of course every programmer always
- checks the result of every system call
- writes appropriate code to deal with the case that the system call failed
- actually tests all of these special cases to see that nothing bad happens.

And I have a claim on some Martian real estate that you really should buy.

Hmm.. perhaps it was raised to infinite already in TOS 4.04?
I can open over 25 windows (I got bored opening them after that)
with TOS 4.04. Of course not with the desktop...

Although I do remember reading back when MultiTOS was released
that MultiTOS expanded the number of windows open to infinite.

Currently GEMMA works fine under MultiTOS and even a multitasking GEM
application has been programmed which works in the STOS interpreter!
There is no visable methods to tell a GEMMA/STOS program to another
language.

Hi Thomas

Thanks for the example below. It's just what I needed. I do indeed
understand assembly language. It's what I write *all* my Atari programs in.
I'm not much of a C programmer at all :)

Thanks to everyone, who responsded to this thread, it's much appreciated.
I am now able to put proper keyboard shortcut handling in POPwatch, CoSTa
etc.

Cheers,
Gary

Yes, this is the desktop - try it again with something like Everest - you'll
get 7 windows (like I just did on my 1.00 STfm).

> Then I tried it with TOS 4.04 on
> my Falcon...the number there did increase to 7... :)

Strange - Desktop on my Falcon allows 8 windows - but this is a desktop
limitation, not the AES - in Thing there is a limit of 16 windows (I
expect forced by Thing), while Everest (3.5e) allows me to open 10...

Try it. :-)

I would suspect that this has got more to do with the desktop than the
TOS/AES
limit it self. The desktop has also got a limit in how many icons you
can have
on the desktop so it wouldn't suprise me if it has got the same limit
with
windows. Try to run an alternative desktop and see what the limit is
or make a program that opens as many windows as possible.

IIRC, each of the printer drivers is an executable program, as well. You
can make PGS load faster by removing any drivers you don't usually use,
and also by setting their fastload bits. But if you start getting crashes,
the fastload bits should be the first thing you change back.

So, would it be possible to put a STOS game in a GEM window then?
That would be cool. Just open a window and all drawings to the screen
will be redirected to that window. Mqybe not that usefull on a ST, but
on a Falcon or Hades ir would be cool. :-)

You'd best use vro_cpyfm() then... I could look up some example
code for this function if you like. Only problem would be getting
rid of flickering. You could try double buffering, but it'll use
a lot of CPU time on a system without blitter (and a lot of bus time
on a system with blitter).

Not having written a game I've not done this but it should work:

The likes of vro_cpyfm() are much easier to use if they work on the screen. So, if we declared a second block of suitably sized and aligned memory for a shadow screen we could toggle logbase to write to each with a simplified vro_cpyfm() and physbase to show the required screen.

If multitasking is a consideration then the only problem which should arise is when logbase is not set to the original place. Either we could stipulate the game be installed singletasking, or block task switching until logbase reverts to the original place which it will do often enough with a half decent frame rate. By its very nature, there wouldn't even be a need to allow a user preference which method is used.

For double buffering you will not need to make copy of screen
but use the xbios (first) to set your new screen for your game
with Setscreen(0.L,0.L,3.W,mode.W) and switch your screen (second) by a
Setscreen(your buffer,your screen,-1.W). Don't forget to swap the address
of the screen before do it. The Xbios will perform a Vbl sync to swap
the adress.

Thats not a very portable solution though - they clearly say that they want
it to work on all Atari machines, and VSetScreen (setscreen with res= 3)
is a Falcon call...

5796. HELP! TT floppies died again!

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-14 00:00:00 UTC
From: bdc2@po.cwru.edu
Message-ID: <5vfmb0$l4t@alexander.INS.CWRU.Edu>
Source record: 6347

This is absurd! I have two TT's, and have been trying to
rearrange them so I can give one to my daughter. A couple of nights ago,
I posted about my floppies "disappearing" on one of them. Under thing,
when clicked on a floppy, or typing alt-A, which should open it, it just
dings. Under the desktop, I get a message

Device A: does not exist

And then after making the post to CSAS, and playing with the SCSI port,
un-plugging and then plugging in my ZIP drive, it started working.
Tonight, I swappped memory between them, (one had 4+4, and the other
10+16, both Atari boards) and now the other computer has the floppy locked
out!!! Is there a virus that does this shit? Has anyone ever heard of this?
If I try cold booting for a floppy, the light doesn't even go on.
It's not power shortage, cause the second TT is in a tower case, with a
separate, large power supply. UI am going wild, trying to figure it out.

Can anyone help? Has anyone encountered this before?
CPX's that look at the disks don't see it. It makes no sense to me.

HELP!!!
Boris Cahan

5799. Programming info for PPP Connect

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-14 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <21031993_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 6350
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

I've ordered CAB2.5 inc. PPP Connect from System Solutions and should hopefully get it in a couple of weeks.

I might be interested in modifying POPwatch to use PPP Connect (as well as STiK etc.). To do this I obviously need programming docs for PPP Connect.

Does anyone know if these are publicly available? If so, where I can get them? I guess they'll be in German which is going to be a pain :(

Cheers,
Gary

5800. Re: Keyboard Processor / Joystick Input / Games / Speed

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-14 00:00:00 UTC
From: warpstar@typhoon.xnet.com
Message-ID: <5vha33ibo1@flood.xnet.com>
Source record: 6351

Hi,

Welcome me to this group, its the first time that I posted.

I'm trying to write a simple game demo for the Atari STe utilizing both the blitter chip and the joystick.

My blitter routines work fine. It's the joystick part thats messing up. I'm using keyboard command $14, which seems like the accepted conventional way of doing it. It seems to work fine, until I place the joystick routines in a loop with my blitter routines. Then command $14 likes to place $ff into the buffer for the joystick input. This makes the control spotty at best.

BTW, my blitter routines all use HOG mode.

What I'd really like to know is how to gather keyboard and joystick information directly from the hardware, and bypass TOS altogether in this regard. I'll probably have my own routines for directly writing the score to the screen as well.

I tried to grab the info at $fffc02 which is the input for the Keyboard ACIA. I know that in this case, my program would have to understand the difference between keyboard and joystick input. No big deal. Well, when I use this approach along with my blitter routines in the same loop, it still does not work out. I think that the keyboard processor is still trying to work with the system while the blitter is in HOG mode, and in that case does not know what to do, as HOG mode hogs the bus entirely. In that case it gets confused and says that input is ff, which it isn't.

I will entertain even flames on this subject at this point. But, I have a few more ideas to try.

Yes, but it is an example, you can use also mode 0,1,2 for ST: it will be
not very
beautiful but you can test the computer with cookie and do the right thing

Message-ID: <341C7C62.2ED32923@cgocable.net>
Source record: 6354

I would like to find some information on the Atari ST Instruction
set,memory maps and file registers, can anyone help?
I have programmed in ass'y before on another platform and would like to
give it a try on the old Atari and see what I can come up with.
rhayes@cgocable.net

5804. ST Programers, please read

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-15 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <5vi10v$e6p@news2.tds.net>
Source record: 6355

I'd like to ask current and former Atari ST programmers with software
available for downloading or other forms of distribution to stop by my site
and take a few minutes to fill out a form.
I'm trying to provide a one-stop source for up-to-date registration
information on programs whose authors may have moved, physically or
electronically, since their software was made available. In addition,
I plan on providing a synopsis of programs and system requirements for all
programs.
Don't pay too much attention to the rest of the site yet, as geocities
doesn't allow passive connections, which I seem to be limited to with
TOS 1.62, and I have to use a local internet cafe to upload my pages. At
the moment I am concentrating on compiling as much information as
possible.

NOTE: There is one area in the form, under the heading "Support"
that works fine with CAB, but I'm not sure whether it works
with Netscape. I ran a test of it at the cafe, and it only
returned 1 selection (I really can't remember whether I
selected more than one item or not). Multiple items were
returned from my tests with CAB.

Anyway, thanks for reading, and please visit the following page at
your convenience:

http://www.geocities.com/siliconvalley/peaks/6320/author01.htm

i was told, that the BLIP-Docus are the same then the Docus to PPP-Connect.

You need the documentation (the commands are the same as used in unix:
sock_init(), socket(), bind(), listen()) the only differencies are:

sread(), swrite(), sfcntl(), sclose()

which have all an "s" in front of the command.

But you hade to use an Library, in which these commands are defined.

With these Informations i tried to write a program, but i earned always an
errormessage from "socket()". So i the compiled program doesn't run.

The programmer of PPP-Connect (Sven.Kopacz@LB.maus.de) is now learning for
his university exam's, so he is now had to think about another problems.

Should i send you the BLIP-Archive icluding the Programmingdocumentation.
But it's in German!

Greatings Michael

SetScreen don't work on for instance Hades. You would have to test
the video cookie to see if you are running on a Atari at all..

However being an old demo and game programmer I must add that
double/triple buffering is essential. It however hard to use that
with VDI/AES.

(Slightly off-topic)

I sometimes run into a snag in my programming, and find that if I just walk away from the computer and go somewhere else.

Other times, I get a flash of inspiration while doing something completely unrelated to programming.

Does this happen to you? If so, where are the favourite places you go to when you have a thorny programming problem.

Also, it has often been said (and is probably part of the hacker image) that programmers sit at their computers and consume large quantities of junk food and high caffeine drinks ("Mountain Dew" and "Jolt Cola" come to mind)

Does this sound familiar?

Just curious - I wanna see if I fit the Atari Hacker prototype.

(Sorry for being slightly off topic, but at least it is programmer related)

What type of communication do you want to do? The easiest way to
use the serial and parallell port is to use BIOS or TOS.

>

Possibly, I've had an idea to create a new traps routine for windows
- to use real windows instead... but I hardly think it would be that
good :-)

And because of the way STOS works, games wouldn't be multitasking, you
could run them with MultiTOS, but not be able to change to another
application/run another :-(

And BTW, I've created another extension called "NetWorld". It's
another extension for STOS which lets to interface with STiK to
connect to the internet! 8-)

5819. Stik Programming

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-19 00:00:00 UTC
From: David@ritter.demon.co.uk
Message-ID: <97264509_000008_OASIS_NEWS@ritter.demon.co.uk>
Source record: 6370
Body handling: Inline uuencoded payload not displayed: SOURCE.ZIP

I've recently started playing around with STik programming and
have run up against a small problem.

I'm trying to write a small talker program to enable others to
log on to my machine and send messages directly to me. (sort of
like an internet pager)

The problem is that data transfer only seems to take place when
my program is the top application or I interact with one of its
windows.

The problem is not with the programs evnt_multi loop as I include
timer events in that.

I have included the asm source code for the data transfer parts
of my program. Could anyone possible help me out?

David

5820. HOW TO ATTRACT GIRLS INSTANTLY....Secrets to instant sex appeal!!!

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-21 00:00:00 UTC
From: SEX APPEAL INSTANTLY <jason@compuserve.com>

HOW TO ATTRACT GIRLS INSTANTLY....Secrets to instant sex appeal

PURE INSTINCT PHEROMONE ATTRACTANT FOR MEN
WILL GIVE YOU AN UNFAIR ADVANTAGE WITH WOMEN
GUARANTEED

(or your money back)!

Everyone knows that some men (a tiny minority) are able to instantly attract women. It used to be known as "animal magnetism". Scientists now say this natural attraction is due to pheromones - body smells that are not consciously detected, but that effect the behavior of others towards the person giving off these chemical signals. It's natures way of attracting the opposite sex. Scientists have now isolated and synthesized two natural Attractants- androstenol and androstenone pheromone. Carefully controlled experiments show they work and have been widely reported on television and in both the British and international press. Androstenone pheromone has been successfully tested on BBC TV's "TOMORROWS WORLD" and by Desmond Morris (Author of "The Naked Ape" and "Manwatching" and renowned human behaviorist) on BBC TV's "Friday Night... Saturday Morning."

New improved formula PURE INSTINCT from ICT Research Technology contains both ANDROSTENOL and ANDROSTENONE pheromone and produces and undetectable scent that subconsciously attracts women to the wearer. PURE INSTINCT is the world's number one selling and the most concentrated (5 - 7 x normal active strength) pheromone spray for men - don't be misled by cheaper (or more expensive) imitations.

WHAT THE PRESS SAY:

* Lowell Ponte, a former consultant on exotic weapons and a Readers Digest science writer, said in an interview that "use of the recently discovered chemical Androstenone should be banned. Congress should pass a law making it a crime to use this chemical to influence voters by making politicians appear more lovable.
- The San Francisco Chronicle -

* "The stuff attracts women like you wouldn't believe"
- Colorado Telegraph

* "And now this pheromone has been marketed, we've tested it - and good grief it works"
- Koave

* "pheromones influence human behavior in a subtle way. Women are attracted to the smell"
- The Daily Telegraph

* "Pure Instinct is likely to produce a state of sexual excitement or arousal"
- Men Only (Vol. #44 No. 4)

Much of our sales of PURE INSTINCT are reorders from existing users, reports confirm success. "PURE INSTINCT really does seem to work! The most dramatic instances have occurred when wearing it at discos. Girls just drift towards me and start flirting."
-DT Cardiff

"I Knew PURE INSTINCT wasn't a gimmick when one of the girls at work, quite out of character, started to seduce me when we were alone in the office."
-SD Nottingham

PURE INSTINCT comes in a discreet 15ml pocket roll on container with full instructions, Ideal for any man who wants to join that lucky few who have more than their fair share of sex appeal.

30 DAY MONEY BACK GUARANTEE

If you are not 100% delighted with the results from using PURE INSTINCT simply return remainder within 30 days for a full refund- No questions asked!

5821. Memory above 4 MByte limit

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-22 00:00:00 UTC
From: pls@no.spam
Message-ID: <605nh5$kd2@bcrkh13.bnr.ca>
Source record: 6372
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

I have put an extra 4 mbytes of DRAM above the MMU 4 Mbyte limit on an STFM.
I am using the original MMU + a small GAL to address this new memory.

Initially, I had problems where TOS 1.04 was not able to use this memory.

TOS 2.06 is able to use the memory, I use the Maddalt function to let it know
about the new memory.

I noticed that TOS 2.06 grabbed a chunk (16000 bytes) of this new memory for
itself right away. It appears to be using this memory as a buffer, for drop
down menus, window operations & possibly disk operations. Is this normal?

I believe this memory should be of the type 'TT Fastram', which means that It
cannot be used for screen or DMA operations. I expected it would be available
for programs only, I had hoped the system would not use it, but perhaps I am
mistaken here.

Does anybody know how/what happens when the ST finds extra memory?

Well at least show the error code and exit.

>- actually tests all of these special cases to see that
>nothing bad happens.

Well there has to be something for memory.Or else PKZIP would just keep eating
up memory until it crashed.I've run PKZIP on 1MB PCs before with no errors.
PKZIP was writen long beofre there were 16MB PCs.

I have Pascal source code to some software, but I have no experience with Pascal and do not have a compiler.

I am looking for someone who could compile the program for me for 68K TOS.

I believe it was previously used with "Turbo Pascal" on an IBM compatible machine, if this makes any difference, and the source code is quite large.

If you could help me at all with this, please get back to me. Your assistance would be much appreciated.

Pascal isn't known for its portability. Still, you gould try and
grab "p2c" from any good FTP site. p2c is a Pascal to C converter, which
has been used among other things to create a C version of TeX...

Assuming nothing in the source is machine specific (e.g., low level port IO, embedded ASM, weird text or graphics modes), you should be able to have it compiled under Pure Pascal, which is supposedly completely compatible with Turbo, including the object-oriented stuff and BGI graphics.

Yes, the AES allocates a buffer of 1/2 the screen size (1/4 in pre-1.4
TOS) for that exact purpose.

> I believe this memory should be of the type 'TT Fastram', which means that It
> cannot be used for screen or DMA operations.

It is correct that you cannot set the screen display base to point to
alternate RAM, but the VDI can copy to/from it. The Blitter can't be used
to do the copies, though, so I'd imagine the VDI does a straight CPU-based
copy in this case.

> I expected it would be available
> for programs only, I had hoped the system would not use it, but perhaps I am
> mistaken here.

TOS is free to use any memory you add to the system as it sees fit. In
fact, you'll probably notice that desk accessories always load into
alternate RAM, regardless of their header flags. If you really wanted to,
you could probably write a hack to prevent it from doing so, but why
bother?

```
p > Does anybody know how/what happens when the ST finds extra
p > memory?

Normally, any request for memory (Pexec or Malloc) gets the largest
block of contiguous RAM, wherever that is, unless otherwise
restricted by the program flags or by calling Mxalloc().

Unless you have a blitter chip, there is no advantage for using ST
RAM for anything except the screen image and the floppy/ACSI DMA
buffer.

Here we go again, sorry it's rather late.

The new addition of ICTARI, the Atari programmer's disk-zine
is available at:

http://www.elis.demon.co.uk/ictari/ictari49.zip

(Demon's WEB-server seems to be taking a while to catch up,
the main site is http://www.elis.demon.co.uk/ictari/ictari.htm)

Anyone who's been threatening me with articles might consider
carrying those threats out if there;s going to be an ICTARI 50.

Have Fun,
"Augeas"

Gentlemen and Ladies,

There is a project going on to create a Virtual Macintosh Plus. It is operational at this time and is available as source code. It has been ported over to quite a few platforms. It would be nice if it were to be ported to MiNTOS. Being able to run Mac in a GEM window under MultiTOS would be quite nice. Especially if LAN support can be created and further support to bring it up to Mac II emulation. Here is the website to download the source code and other necessary files.

http://leb.net/vmac/

Hello MiNT programmers/users...

I am in the process of collecting patches for PL48 of the MiNT library. If you have been working with PL46 or PL47, and made modifications that are of general interest to the users of the library, why not have your contribution become part of the public release?

If you do not subscribe to the MiNT mailing list, and are unaware of changes since PL46, please dowload PL47 at funet.fi or ftp://ftp.cam.org/users/ypell, and verify that there is no duplication of effort between previous patches and yours.

Thanks

Yves Pelletier

Not trimming, cause I missed the in-between posts, (but found them on DejaNews).

I speculate that PKZIP crashed in parsing the file names for some sort
of final directory totals or something ... who knows exactly, but
not many programs can handle that many individual files (about 6300).
It may just have been a conflict with QEMM7.5 .. I do have to use
the PKZIP switch to turn off 32 bit DPMI usage as a mater of course.

I mostly wanted the PkZip file as a means to save redundant backups easily
(it takes too long to do anything with 6300 files individually).
I've got it done, and have the files individually on the Zip disk.

5836. Z80 assembler found

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-29 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <J2TQCXM@tos.pl.net>
Source record: 6387

Some of you may remember my post a while ago about a Z80 assembler. I was looking for such an assembler suitable for using with an Atari ST series machine (actually a TT in this case).

I obtained Pascal source to such an assembler but was unable to compile it since I don't have a compiler (hence my post regarding the Pascal compiler) but fortunately I have found C source code to a Z80 assembler (also included in the package are 6800, 6801, 6802, 6803, 6804, 6805, 6808, 6809, 6811, 8085 and 8080 assemblers).

It compiled first time with Lattice C 5.6, and the resultant assembly seems to be correct, although I haven't checked every possibility. In combination with the supplied linker, the assembler can generate Motorola S19 or Intel Hex format output.

Now I just have to find out the format of the Motorola S19 or Intel Hex, although they look simple enough so I'm sure this won't be a problem.

If anyone else wants any of these assemblers, I would be happy to send them.

5838. mp3 on atari?

Newsgroup: comp.sys.atari.programmer
Date: 1997-09-29 00:00:00 UTC
From: Vincent Bakker <bakkerv@pi.net>
Message-ID: <343010F9.3C30@pi.net>
Source record: 6389

Hello fellow programmers,

is there anyone who has tried to mp3 en/decoding on the atari (falcon).
I haven't yet found any atari related mp3 stuff, but since the source
code for mp3 en/decoding is pub. domain, I can't be the only one trying?

I got the source compiled, but it doesn't work, at least it can't get a
sync on the input mp3 file; I think it's got something to do with
little/big endian conversion of the input file to mp3 bitstream, but
right now I'm stuck.

any info or help appreciated..

greetz,
Vince

Yes there is a port on its way. I havn't heard from it for a while, but
I guess it's getting there. Last time I heard from him (Thomas
Berndtson)
he was busy with studies and wanted some help for speeding the
develpoment
up. Maybe you want to help?

Anyway, it sounded very promessing so I guess we will get a player one
day.

Body handling: HTML body converted to readable text

Thomas Much and Gotz Hoffart are begining work on The TOS Book.

This freeware HyperGuide and HTML document will eventually
document ever TOS enhancement (NVDI, WDIALOG, MiNT, etc.)
to become the definite replacement for reference materials
such as The Atari Compendium and the Atari Profibuch. Best
of all, IN PLAIN ENGLISH! ;-)

Should people with expertise in MiNT, MiNTnet, STiK, STinG,
OLGA, WDIALOG, NVDI or just plain Resource styling contribute
to this ongoing project, it might ensure the future of Atari.

Check it out on Thomas' Homepage:

Message-ID: <7358_mike@bbsgate.interware.REMOVE.TO.REPLY.it>
Source record: 6298

Here I try again to find somebody who can help finding a PureC 1.1 of 22 Gen
1993 (not 1992):

I've found on a BBS:

PD_PATCH.ZIP 76k [1] V1.01 des Patchprogramm f�r den PureDebugger. Er
behebt Probleme die haupts�chlich unter Multitasking
auftreten, benutzt XBRA, TT-RAM als Grafikspeicher, Esc H
Ausgabe kann abgestellt werden. Au�erdem kann eine
2-Monotorversion erstellt werden. Alles incl. Quellcodes
in C und Assembler (Pure C/Pure Assembler)

And in a file of this archive:

```
/* Patch_PD
(c) 1997 by Dimitri Junker
Adenauerallee 30
52066 Aachen */

/* Meine Version -> allgemein: f_name; EdDI_1_1;vq_extnd; */
```

I would like to contact this author by email, as I do not understand German.

I would really like to set up a PureC-Debugger environment on my system with
MagiC and the Crazy Dots2 NVDI ET4000, this seems possible, but I can't
understand enough, can anybody help me ?

I cannot compile the program for v1.1 of 1992, libraries and headers missing.

Hello everybody,

I've put on my home page the October release of Eureka 2.12.
It's a 2D Graph Describer and a 3D Modeller. It's freeware
and will run on all Atari platforms and most emulators.
It has now, thanks to Karl SAMYN, an English documentation.
All the program is in two languages : French and English.
You may tell me more about the English translation, and
mistakes I would have made. I'm expecting a feedback for
it. Thanks to all ... Bye for now,

-- Francois LE COAT
WEB : http://www.ief.u-psud.fr/~lecoat

HI!!

I've written an RTF to HTML converter using ANSI C standard libraries, it's freeware for various computers, but I want to make an ST version for Marcel users. So, if I send someone the source code, can they compile it in Atari ST C (pref.68000 code), and send me the object code? I'll give you full credit for it, and post the object file on Atari.Binaries and my Webpage.

Thanks.

I still have a few hardware bugs to sort out.

One of these is the 'wavy' lines that appear when the mouse is moved onto the menu bar & a new drop down menu appears.Some screen pixels are getting corrupted.

This happens to a lesser extent when a window is redrawn.I don't have a blitter installed.

Is the VDI copy operation particularly fast, or does it have some special way of reading/writing to memory?

>> I expected it would be available

>fact, you'll probably notice that desk accessories always load into
>alternate RAM, regardless of their header flags. If you really wanted to,
>you could probably write a hack to prevent it from doing so, but why
>bother?

I was hoping to use this memory only for programs, I recently installed MiNTnet & find the lack of memory a problem. I was hoping to use the new memory for daemons & drivers, leaving the ST ram for programs that need it.

Until I solve the screen corruption, the new memory is of limited use.

One thing I did find strange is that a program called RAMTEST finds many errors in the new 4 Mbyte block, while my own memory testing routines do not.

Anybody familiar with the program RAMTEST?

Sysinfo reports a weird memory configuration, ie.

8192 Kbytes of ST RAM
3910346 bytes of Free ST RAM

0 bytes of TTRAM
4104657 bytes of Free TT RAM
8015003 bytes of used ST & TT RAM
Total ST & TT RAM 8192 Kbytes.

I don't know of any way to tell the ST that the memory above $400000 is alt ram, does it know this already? Is there some location, like the MMU configuration register that the OS reads for alt ram?

Source record: 6311

> Does anyone know why the STOS compiler comes up with a file error when
> compiling files on the Pacifist Emulator 0.46?

Things that frequently cause "file error"s...

1) Corrupt files in \compiler\
2) With PaCifiST 0.45, STOS worked better from a disk image - try this.
3) Too many files on the "drive" - STOS seems to have a limit on the
number of files on the partition that it is run from. If you are
mounting your entire PC's hard-disk, try a smaller subset of the
drive. (I have witnessed this error on my Falcon).
4) What version of the compiler are you using? If it is my beta 3 then
download the beta 2 as several major bugs were introduced (including
one which sometimes generates file errors). Hopefully a fixed beta 4
will be ready soon...

If this doesn't help, mail me and I'll see what I can do.

Anthony

Could you please describe how these "wavy" lines look like?. I had a similar
problem due to a ground loop that made the GLUE produce wrong video timing.

Are some memory positions corrupted? In that case I would suspect EMI
or faulty soldering/ground.

>I don't know of any way to tell the ST that the memory above $400000 is alt
>ram, does it know this already? Is there some location, like the MMU

There are some Alt ram related system variables. Have you set them
correctly?

If you use MiNT the most easy solution would be to alter the mint kernel
since it handle all M(x)alloc's itself. Otherwise you can setup the
Alt-ram related system variables using a small auto folder program.

The lines appear then the mouse moves between two horizontal entries on the
menu bar, never when moving vertical.

The lines are temporary, in that they go away when the mouse is still. The
line appear to be approx 16 pixels long (in 640X400 mono) & are white on the
desktop background.Sometimes a few desktop pixels are changed, but these
revert to normal when the desktop is redrawn.

They are horizontal & are spaced 12 mm appart. The number of lines appears to
be related to memory activity, ie. clicking on a desktop icon produces a few
lines, highlighting an icon & then moving it around the screen causes more.

It definitly appears to be screen related, perhaps when the OS is moving
things around the screen.

>Are some memory positions corrupted? In that case I would suspect EMI
>or faulty soldering/ground.

When the memory is tested on its own, there appears to be no problems.

>>I don't know of any way to tell the ST that the memory above $400000 is alt

>>configuration register that the OS reads for alt ram?
>
>There are some Alt ram related system variables. Have you set them
>correctly?

All I have done is to use 'Maddalt' to tell the system about the memory.

I don't know about any other variables, do you have specific information?

I am concerned the OS thinks the new memory is ST ram & is trying to access it
like memory below the 4 Mbyte limit. Is the vdi copy process different from

other memory operations?

>If you use MiNT the most easy solution would be to alter the mint kernel

5864. NEO to BMP converter

Newsgroup: comp.sys.atari.programmer
Date: 1997-10-07 00:00:00 UTC
From: Paul 'Ozymandias' Harman <ozzy@kasterborus.demon.co.uk>
Message-ID: <61dio7$6qa@pepper.compnews.co.uk>
Source record: 6315

I have written a Neochrome screen to Windows BMP converter for the ST. It was written in STOS.

If anyone is interested I can send ST executables or STOS source code.

I am working on a STOS compressed screen to BMP converter, and a STOS Sprite to BMP converter too.

Ozzy

> key and to drive the "ship" at the same time...

This is a little complicated problem on Atari's unfortunetely. I don't have a C example, but I'll try to explain how it's done.

The hardware register $fffc02 gives a scancode for a key when it's pressed down and another code (scancode OR'd with $80) when the key is released. So, what you need to do, is to have saved in a small buffer which keys are pressed down, when you get a "keypress" code, and then remove the key from the buffer when you recieve a "keyrelease" code for that key. This works with two keys at the same time, but not more due to restrictions in the keyboard processor.

Another common solution to the problem is to use Shift keys, Alternate or Control for fire. These keys are handled in a different way by the keyboard processor, and it is therefore possible to have shift pressed together with another key.

Hope it helped a little. :)

Greetings,

Tomas

Yes please, do help! ;)

I'm doing a little at a time, since I don't have that much time now
when studying. That means I haven't stopped programming on it, it's
just going a little/much slower right now.

Sources for encoding has been very hard to find for a long time, but
here is where you can get them:

ftp://ftp.tnt.uni-hannover.de/pub/MPEG/audio/mpeg2/software/technical_report/

I haven't tried to compile them on Atari, and I don't think I want
to. My brother says it is MUCH slower than the shareware, binary-only
l3enc that is available for some platforms, obviously not Atari.

In my conversion into DSP assembler, I use "amp" as base. It's C
sources and is compilable in Linux on my Falcon, but of course there's
no chance of realtime playing with it there. You can find amp and some
other free players through http://www.mpeg3.com along with a bunch of
other info.

The video base is still in ST ram, but the buffer the OS uses for drop down
menu's is in Alt ram.

I tried using the 'rdisc_tt.ttp' program; I hoped I could sieze all of the alt
ram before the OS took some away, but the ram disk program was not able to
find the Alt Ram.

Do you use 2.06 or MagiC? Both handles "TT-ram" without problems, "lesser"
versions doesn't. With 2.06/MagiC and upwards it should (atleast in theory) be
sufficient to register the new memory with Maddalt().

Perhaps you need to set some system-variables as well, but I really doubt that.

Source record: 6323

Hey everyone,

I'm trying to send codes to a printer, such as text styles, line spaceing, initialization e.t.c. However when sending the codes to the printer Via LPRINT it prints what I'm sending or at least some of it, and does not set the configuration.

Example:

Esc command for double strike mode on an epson printer is ESC G with decimal 71.

```
Double.strike.on$=chr$(27)+"G"+chr$(71)
LPRINT double.strike.on$
```

Once this is sent the printer prints G and nothing changes. Does anyone know how to send esc codes to the printer in string format. I can use the OUT command with varibles but it gets very lengthy, especially when sending many codes with ,'s seperating them. Anyhow I'm doing this in GFA BASIC. Any advice on how to do this would be greatly appreciated.

Scott.

Hou... I've done that a few years ago in an arcade GAME and I was
driving 4 keys at the same time. I think that it will be more easilly in
ASM that in C. In fact one of the main problem with that (key and
joystick) is that if you put your routine in hardware (eg $118) you will
disabled your debugger. So try to find other vector (using Iorec and
Kbdvbase).
Good Luck

I am using TOS 2.06 & I just have small program that uses Maddalt() to
register the new memory. When I look at the memory descriptor blocks
afterwards, I can see the new memory & the chunk the OS has grabbed for
itself.
>
>Perhaps you need to set some system-variables as well, but I really doubt that.

I think you are correct, I am not able to find any documentation about what
the variables are or might be.

TT owners may be able to help here, the TT's Ram can be both ST & TT.
The ST memory configuration is written to a location in memory, the value of
which is dependant on the memory found at startup.

How does the TT record the value for TT Ram?

I have looked at the file which gives the Atari registers for all of the
machines & there is no memory configuration for the TT in the file.

There is for the ST, but surely this cannot work for both machines.

How do the machines distinguish between ST & TT Ram?

Is it automatically given that any Alt Ram must be TT Ram by definition & the
OS ensures that DMA access cannot take place?

I now feel that I would be better off having 8 Mbyte of ST Ram, at least this
would mean the screen would be at 7F8000 & all the memory would be in one
block.

Doing this is not easy, however.

AFAIK printers will not send "property" codes. Nor will they send
"status" for bad codes.

This means that printer properties are always registered manually
somewhere i.e. in a program's "inf" file or in a devices property
record (for GDOS or NVDI).

It's a good point though. Why WON'T printers tell us what they
look/feel like??

5886. HOW TO ATTRACT GIRLS INSTANTLY....Secrets to instant sex appeal

Newsgroup: comp.sys.atari.programmer
Date: 1997-10-11 00:00:00 UTC
From: INSTANT SEX APPEAL <larry@sprynet.com>

HOW TO ATTRACT GIRLS INSTANTLY....Secrets to instant sex appeal

PURE INSTINCT PHEROMONE ATTRACTANT FOR MEN
WILL GIVE YOU AN UNFAIR ADVANTAGE WITH WOMEN
GUARANTEED

(or your money back)!

Everyone knows that some men (a tiny minority) are able to instantly attract women. It used to be known as "animal magnetism". Scientists now say this natural attraction is due to pheromones - body smells that are not consciously detected, but that effect the behavior of others towards the person giving off these chemical signals. It's natures way of attracting the opposite sex. Scientists have now isolated and synthesized two natural Attractants- androstenol and androstenone pheromone. Carefully controlled experiments show they work and have been widely reported on television and in both the British and international press. Androstenone pheromone has been successfully tested on BBC TV's "TOMORROWS WORLD" and by Desmond Morris (Author of "The Naked Ape" and "Manwatching" and renowned human behaviorist) on BBC TV's "Friday Night... Saturday Morning."

New improved formula PURE INSTINCT from ICT Research Technology contains both ANDROSTENOL and ANDROSTENONE pheromone and produces and undetectable scent that subconsciously attracts women to the wearer. PURE INSTINCT is the world's number one selling and the most concentrated (5 - 7 x normal active strength) pheromone spray for men - don't be misled by cheaper (or more expensive) imitations.

WHAT THE PRESS SAY:

* Lowell Ponte, a former consultant on exotic weapons and a Readers Digest science writer, said in an interview that "use of the recently discovered chemical Androstenone should be banned. Congress should pass a law making it a crime to use this chemical to influence voters by making politicians appear more lovable.
- The San Francisco Chronicle -

* "The stuff attracts women like you wouldn't believe"
- Colorado Telegraph

* "And now this pheromone has been marketed, we've tested it - and good grief it works"
- Koave

* "pheromones influence human behavior in a subtle way. Women are attracted to the smell"
- The Daily Telegraph

* "Pure Instinct is likely to produce a state of sexual excitement or
arousal"
- Men Only (Vol. #44 No. 4)

Much of our sales of PURE INSTINCT are reorders from existing users, reports
confirm success. "PURE INSTINCT really does seem to work! The most dramatic
instances have occurred when wearing it at discos. Girls just drift towards
me and start flirting."
-DT Cardiff

"I Knew PURE INSTINCT wasn't a gimmick when one of the girls at work, quite
out of character, started to seduce me when we were alone in the office."
-SD Nottingham

PURE INSTINCT comes in a discreet 15ml pocket roll on container with full
instructions, Ideal for any man who wants to join that lucky few who have
more than their fair share of sex appeal.

30 DAY MONEY BACK GUARANTEE

If you are not 100% delighted with the results from using PURE INSTINCT simply
return remainder within 30 days for a full refund- No questions asked!

5887. OberonV4 beta for Atari-ST available

Newsgroup: comp.sys.atari.programmer
Date: 1997-10-11 00:00:00 UTC
From: eglis@ubaclu.unibas.ch
Message-ID: <1997Oct11.100803.47627@yogi.urz.unibas.ch>
Source record: 6338

A new release of ETH Oberon System V4 for Atari ST & TT computers is
now available. Oberon is a programming language together with a complete
operating system, developped at ETH Zuerich by Nicklaus Wirth, the inventor of
pascal and modula-2. For more info about Oberon have a look at
http://www.math.tau.ac.il/~guy/Oberon/

The release can be downloaded at ftp.inf.ethz.ch in the folder
pub/Oberon/OberonV4/AtariST

The system is supplied with an Oberon(-1) compiler, a linker and
comes with complete source code. Please remeber that the Compiler does not
support all Oberon-2 features, to wich some of the documentation is referring
to.

ST-Oberon has been tested on TOS 1.0 and 1.4 on a 1040STF, a MEGA ST2
and a Stacy. It may be that the current version of Oberon won't run
on the newer TOS versions, since it uses some system variables, and
modifies the exeption vectors.

Hardware Requirements:

Atari ST or TT computer with at least

2 MB RAM (for serious use, altough ST-Oberon will also run with
only 1 MB)

4 MB of harddisk space, preferably on a harddisk connected to the
ACSI port.

have fun!

please send bug reports or feedback to eglis@ubaclu.unibas.ch
under the subject "stoberon".

Well, I must say I had an excellent response from this newsgroup. Thanks, everyone!! It's compiled now, however, so you don't need to reply anymore!! (I just don't want to waste anyone's time...)

As for the compiled program itself, if anyone wants to get hold of it, I'll post it on de.alt.binaries.tos, assuming that's actually for the Atari, and not something... unsavoury. I'll also upload it to FTP sites when I can work out how to, and put it on my Webpage (address below)

If anyone wants the RTF to HTML, or HTML to RTF source code, then feel free to E-Mail me for it. I'll wait a week or so until I've got enough responses, and then send it all off as one message (to cut phone costs 8-(

Thanks again,

Jeremy Smith.

To reply by Email, reverse the first bit.

The only difference is the STFM has a TV Signal _M_odulator so you can use the machine on your TV. Otherwise, it's the same machine. (Please keep in mind I'm in the U.S.... YMMV and all that jazz.)

>Once this is sent the printer prints G and nothing changes.

It's "ESC G G" you send... The correct code for double strike is
simply "ESC G" (and "ESC H" to go back to single strike). So it's normal
you get a double striked single G letter on the paper. Better use:

Double.strike.on$=chr$(27)+"G"

>Any advice on how to do this would be greatly appreciated.

Could be declared as a function too, something like:

DEFFN doublestrike$(on!)=CHR$(27)+CHR$(ASC("H")+on!)
LPRINT @doublestrike$(1);"You know what? I'm happy.";@doublestrike$(0)

Thanks. I had figured it out after words, I just misread the
manuale for the printer. I had to write a rountine which converts the
string codes into varibles and then sends each varible to the printer with
OUT command. I had to do it this way because alot of codes are being send
to the printer to configure it, in a way the user defines. So using I
would have had to make a number of functions, rather than one routine
which when called send whatever the user defined as the setup.

Thanks again...

Scott.

> I've just read someone mentioning a tfork() call. This would be a
>mintspecific call, but I can't find any info on it. Anyone?

tfork is just a bit of wrapper code around Pexec. It's provided in the MiNT library. Basically it allocates a base page and a stack, stores the passed-in function address as the start address of the new basepage, then Pexec's (using I forgot which mode, new process using existing memory image) to start the new process. The process is considered a "thread" in that it shares the contents of the parent's address space - all code, data & bss space. Heap is a separate issue which generally is not taken care of. Specifically, malloc() and related routines cannot be used safely by the new process. The stack is initialized; as I recall a call to Pterm is stored on the stack so if the new process returns all the way to the top, it exits.

(Note - malloc is a problem for two reasons - the obvious one, thread re-entrance and mutex issues, but also because the MiNTlib malloc() tries to do stack/heap collision detection. In the original process, the heap and stack are both carved out of one chunk of memory, and the heap grows upward from the bottom, and the stack grows downward from the top. If they meet in the middle, malloc has to give up. In the threaded subprocess, the stack is in a freshly allocated memory region, but the heap remains where it was in the parent process. The new stack could be either above or below the original one, so the library's collision detection code is useless.)

I've written a couple of pieces of code that used this function, (including the first pass at my update to the MiNTnet driver for CAB) and I've dissected it quite a bit. It seems to me that the Pexec functionality it uses is a bit broken; the new process doesn't share the file descriptors of the parent process, for one. Also, it seems to be dependent on the memory-sharing flags set in the parent; one would expect that a "thread process" automatically inherits full access privileges to all of the parent's memory, instead of just read access. I've never investigated the MiNT kernel code to verify this behavior, but I believe there's a bug here that needs fixing...

This isn't completely true. I've had problems reading Atari formatted
disks on a Macintosh that can read PC formatted disks. There is some
difference in how TOS formats the disks from how PC does it. What you
need to do, if you're not able to read the disks directly, is to
format a disk on a PC or on a Macintosh as PC format and copy the
files onto that disk on the Atari.

If you don't have a utility for reading PC disks, there is one called
PC Exchange, should be available on various ftp sites.

Greetings,

Tomas

Well, as its sockets I guess the place to look is MiNTnet - either in a
man page, or more likely in the source the the .XDD file - as this is where
the Fcntl on sockets is probably handled.

Hope this helps

Anthony

Hi

I've just been playing with PPP-Connect (that I bought at today's show,
along with CAB2.5).

I'd like to add PPP-Connect compatability to POPwatch if it's not too
difficult.

Can anyone tell me where I can get hold of the programming docs for
PPP-Connect?

Regards,
Gary

There is a hardware/software network which uses the midi port
available commercially.

I started writing one using the serial port, but it kept dropping
bytes. Eventually I discovered that the problem was that the
default serial buffer was too small to really handle 19200 bps, but
by then I was no longer interested in networking my ST and TT.

Same here, CAB 2.5 really flies now, and thats with STiK (1.12).

>I'd like to add PPP-Connect compatability to POPwatch if it's not too
>difficult.

I'd like to do the same with Greendale (when I finish it) and perhaps port
GlueSTiK to it.

>Can anyone tell me where I can get hold of the programming docs for
>PPP-Connect?

I thought it was based on BLIP (they are buy the same author and are very
similar) but the BLIP examples don't work so I guess that something was
changed.

AFAIK, PPP-Connect is a port of Berkley sockets so is programmed like
MintNet.

Look out for Pure C which is very user friendly. It however produces slightly
less than optimal code. If you can't live with 98 % of the optimum, you must
go for Gnu-C, but that one for sure is not very user friendly.

> Also has anyone written a program

Sure, go ahead. I thought about just doing the print server/client bit the
other day, as it's rather easy to do (using STinG). A file server is tricky
however, but will come one day too.

The only thing I know is that it's supposed to be some sort of "intelligent"
compression, like DCC and MD. I doubt that Steinberg would give away their
technology, but who knows - since they won't make any more CAF upgrades
(let's hope they'll continue making bugfixes) for our beloved computer,
maybe they would eventually?

There are many networking type programs & file servers, check umich for a few.

If you have the memory & disk space, you could install MiNT & MiNTnet & get a
fully working NFS connection between the two atari's.

Do you know where I could get a copy of MiNT, and MiNTnet, since I haven't been watching
the Atari world
for quite a while. You couldn't send me a copy could you, or is MiNT no longer shareware?
Also, you suggested checking 'umich'. What is this?

Cheers,
Gerard

> It's used by Xbios as starting in 1968, in binary mode, giving a max
> year of 2223, limited by Xbios (and Gemdos as well) to 2107.

This is wrong, the limit is 99 EVEN in binary mode ....
I just looked to Motorola and also Benchmarq documents
in fact you can put any value in , but it just WON'T get
updated properly when it should ... in the specs the
limit in binary mode is given by motorola to be 0x63
(99) because the chip is intended to be a '100 year calendar'
as they say ....
In other words you can put in 2053 for example but when
it should become 2054 it will loop back to 1968 again :-(
I wonder why they kept this limit ?
So the limit we were searching for is 1968+99 which
is 2067 which seems to be the real atari limit ,
according to Motorola ....

By the way , you were right , day 1 is sunday !

so long,
DAVID GODEC

Hi ,

Does anybody know if and where and how to configure gnu binutils (as/ld)
for an atari st binary format or other relocatable output format ?
If there are allready other bin. formats included in the binu, please
let me know which do what I need.

I currently working on a mutlitasking os without a mmu, when ever I like
to load a new/other program, it have to be relocated to assigned
address.

Hi Gerard,

: friendly) C-compiler for my Atari ST. Also has anyone written a program
: whereby I could use one Atari ST as a file and print server for two
: other Ataris, or would anyone else be interested if I wrote one myself?
: This might sound slightly silly, but I'm trying to squeeze that extra
: little bit of use out of them.

If you do it, I suggest you to use the Unix lpr standard via STIK. This
should be the most flexible solution for printer Servers. Almost any
System available supports it. For using it with existing software you
should best do it as a GDOS driver - optimally for NVDI if you get
hold of a documentation.

For a file Server NFS is the best sollution. ther is NFS for MiNTNet.
Still it can not be used by the majority of users who have not enough
Memory.

Christof

GNU binutils already include lots of binary formats. Not including the
Atari's one by default, but there is a patch to add it (to an old version,
and I've no idea whether it would apply cleanly to a current version).

Hi
Trying to make a game with sprites seems to be the best solution to
use the "flipping" screen method for animation (Setscreen())...
...but this is very machine dependent: I use a TT and Crazy-Dot
graphic card and if there are no problems in TT (video) standard mode
it's no possible use the same method with Crazy-Dots in 256 colors mode.

Is it possible that I make some mistakes about the screen-base address
or there is athers "standard" methods ?

Thank you

Maybe the cartridge slot would have been better (faster) solution. The only problem here, is that you would have to have designed your own hardware, and Atari's strange decision to make the Cartridge slot one-way would have made this task slightly harder. It's understandable why commercial manafacturers opted for the midi ports, even though this stops the networked Atari's from using the midi ports for music!!

You have a good idear, I didn't thought printing was possible thrue NFS,
but when you think about it this should be done linking a file to the
target device on the server, and by allowing others to access to it via NFS.
A good way to to this would be a graphical configuration software for MiNT.
I'm still thinking about one, but I'm not sure to have the knowledge to
make it myself... but it would be a great thing, wouldn't it ?

Actually it would be perfectly feasible to implement a network over a MIDI system without preventing its use for music (although timing might become more of an issue). The MIDI spec includes a message type called "system exclusive" which is designed to implement device specific messages not catered for in the normal MIDI commands. There's no reason why this message couldn't be used as a "wrapper" for network packets, and it they would be safely ignored by normal MIDI equipment.

The actual topology of the network might lead to a few more problems, as it would effectively have to be connected as a token ring, which is not ideal for every MIDI system, and may prevent some MIDI or network traffic being passed correctly. In practice, with some planning, and if the network isn't being used for MIDI and file/print at the same time, the problem can easily be minimized.

All this was discussed at some length on the MiNT mailing list quite some time ago, but nobody ever wrote the necessary routines into a MiNTNet driver (my programming skills aren't good enough for me to take it on). Shame.

Cheers,

Xav

5924. 60's clock

Newsgroup: comp.sys.atari.programmer
Date: 1997-10-25 00:00:00 UTC
From: centek <centek@eeb.fr>
Message-ID: <01bce189$e0740400$LocalHost@p-d-mou>
Source record: 6225

THE MC68060 CLOCK

Some people and some companies, especially french ones, announce
the 68060 to be cadenced at 120 MHz on the HADES 060.
This is totally wrong and only reflects the technical ignorance
about the 68060 and the marketing lies of some companies !

The 060 is cadenced by only one clock : the CLK (that is the PCLK
of the 040 socket !).

You have to know that the 060 is built with the 'STATIC' technology
that allows this 060 to be cadenced with lower frequencies, even 0 MHz
(no clock at all) in the purpose to reduce consummation as much as
possible... But, the way to exit this mode is to send a non-masked
interrupt or a RESET to the 060.

Therefore, the 060 has an internal clock control logic which
itself is also cadenced by an internal clock, which works constantly !
Yes, it's this logic which gets the interrupt and exits the 060 from its
'low power mode'. This is also the logic which stops or starts the
PLL (phase-lock loop), which has to synchronize the external clock with
the internal clock ! It constantly monitors this PLL and if unphased,
returns an external signal LOC/ (Loss Of Clock).
This signal, for example, is a variation of the CLK sent to the processor.
The clock can only be modified during RESET or LOW POWER MODE !
Therefore, the 060 can't (in real time) do an external DX2 like it is
possible on some accelerator cards (CENTurbo II, CENTurbo I 20/40 (1st
generation), Speed Resolution Card, etc...).

Let's turn theory into practice :
Just a little demonstration with a FALCON, an HADES 060, and GEMBENCH
4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030
and the 060.
For the 030: 44 clock cycles to execute the DIVU.
For the 060: 22 clock cycles to execute the DIVU.
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on :
FALCON STANDARD 16 MHz : 100 % (normal !).
HADES 060 at 60 MHz (!): 320 % (767 %).

Here is the equation, no comment.
68060 at 60 MHz = (44/22) x (60/16) = 7.50 or 750 %

On the one hand, we have the theory with the DATABOOK (if some people
want to interpret the DATABOOK differently, we ARE LISTENING!) which
gives 750 and on the other hand, a real test on a machine which gives

767 !
So, the hypothesis for the 060 at 60 MHz is proven correct.
If the 060 was at 120 MHz, like some people would stupidely like us to
believe, the gembench test should have been closer to :

1500 = (44/22) x (120/16) !

Remark : The BUS of the HADES 060 is cadenced at 30 MHz !

A little bit of COMMON SENSE : why would a processor manufacturer
announce on its processors a clock which would only be half of what the
processor calculates for real ?!! Have you ever seen, a manufacturer
half under-estimating its products against the competition?
Moreover, to not even talk about it in its documentations ??!!!
Us, Never !

CONCLUSION : The 68060 is cadenced at 60 MHz (the clock input !)
even if there is an internal DX2 clock !

Rodolphe Czuba
Sacha Hnatiuk
David Godec
Thanks to Emmanuel Barranger (EB MODEL) for his help.

My only regret is the same as the one about the 040 !
Moral : before believing and/or stupidly repeating the proposals of
others, verify for yourself, or verify it with REAL professionals!

Rodolphe Czuba

5925. 40's clock

Newsgroup: comp.sys.atari.programmer
Date: 1997-10-25 00:00:00 UTC
From: centek <centek@eeb.fr>
Message-ID: <01bce18a$53005b40$LocalHost@p-d-mou>
Source record: 6226

THE MC68040 AND MC68040V CLOCKS

Some people and some companies, especially french ones, announce
the 68040 to be cadenced at 64 MHz on the AFTERBURNER 040 or on
the HADES 040.
This is totally wrong and only reflects the technical ignorance
about the 68040!

The 040 is cadenced by two clocks: the BCLK and the PCLK.
The BCLK (Bus CLocK) cadences the processor, its bus controller, as
well as the entire calculation unit (and the floating unit for
the 'full' 040, meaning with a FPU).
The Motorola DATA BOOK for the 040 is very clear about it because
on page 10-4, we can read: 'All timings are related to BCLK cycles...'
By all means, when you read the instruction timing tables for the
040, and for example, it says that the XXXX instruction is 4 cycles
that means that this instruction is executed in 4 clock BCLK cycles!!
About the PCLK (Processor CLocK), the 040 needs it to cadence its
internal logic, especially its pipeline.
This clock could be 200 or 500 MHz, which wouldn't change the
performance of the 040 !!
In this case, the PCLK is twice the BCLK with a phase shift + or -
250 to 500 ps depending on the clock generator used.
With regards to the design, you can give a PCLK divided by 2 to get
the BCLK.
A more popular approach is the opposite starting with a BCLK multiplied
by 2 with a circuit to obtain the PCLK.
Motorola proposes a MC88915 circuit, which is also used
by the Afterburner.

A remark : the 040 3.3V model only exists in two versions :
- The 68040V which doesn't have an FPU !
- The 68EC040V which has neither an FPU, nor a PMMU !

These two versions are identical to the 5V version regarding the
performance (otherwise, where are the instruction timing tables of
this 3.3V version in the DATABOOK which talks about ALL 040 models ?!!).
The only differences are the 'LOW POWER' possibilities of this 3.3v
version which are explained in the appendix C of the 040 DATA
BOOK. With the version V (like on the 060 !!), there's only one clock
injected in the processor : CLK (CLocK).
Of course, this clock is equal to the BCLK, located at the same
place on the casing as the BCLK !
So why only one clock and what happened to the PCLK ?
You have to know that the 'STATIC' technology allows this 040 (and the 060)

to be cadenced with lower frequencies, even 0 MHz (no clock at all) in
the purpose to reduce consummation as much as possible...
But, the way to exit this mode is to send a non-masked interrupt to the
040.

Therefore, the 040 (and the 060) has an internal clock control logic which
itself is also cadenced by an internal clock, which works constantly !
Yes, it's this logic which gets the interrupt and exits the 040 from its
'low power mode'. This is also the logic which stops or starts the
PLL (phase-lock loop), which has to synchronize the external clock with
the internal clock ! It constantly monitors this PLL and if unphased,
returns an external signal LOC/ (Loss Of Clock).
This signal, for example, is a variation of the CLK sent to the processor.
The clock can only be modified during RESET or LOW POWER MODE !
In the case of an active LOC, it is necessary to send a RESET to
the processor, restarting it again in NORMAL mode.
Therefore, the 040, as well as the 060 can't (in real time) do an
external DX2 like it is possible on some accelerator cards (CENTurbo
II, CENTurbo I 20/40 (1st generation), Speed Resolution Card, etc...).

Let's turn theory into practice:
Just a little demonstration with a FALCON, an Afterburner 040, and
GEMBENCH 4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030
and the 040.
For the 030: 44 clock cycles.
For the 040: 27 clock cycles.
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on:
FALCON STANDARD 16 MHz: 100 % (normal !).
FALCON + AB40 at 32 MHz: 320 % (411 % at 40 MHz).

Here is the equation, no comment.
68040 at 32 MHz = (44/27) x (32/16) = 3.26 or 326 %

On the one hand, we have the theory with the DATABOOK (if some people want
to interpret the DATABOOK differently, we ARE LISTENING!) which gives 326
and on the other hand, a real test on a machine which gives 320 !
So, the hypothesis for the 040 at 32 MHz is proven correct.
If the 040 was at 64 MHz, like some people would like us to believe,
the gembench test should have been closer to:

652 = (44/27) x (64/16) !

A little bit of COMMON SENSE : why would a processor manufacturer
announce on its processors a clock which would only be half of what the
processor calculates for real ?!! Have you ever seen, a manufacturer
half under-estimating its products against the competition?
Moreover, to not even talk about it in its documentations ??!!!
Us, Never !

CONCLUSION : the 68040 is cadenced by the BCLK !

Rodolphe Czuba
Sacha Hnatiuk
David Godec

My only regret is that I placed confidence in what a person and a
magazine said, so I announced the same crap in the first version
of the PHENIX 040/060 presentation file before discovering the truth
myself (during the PHENIX development).
Unfortunately, a lot of people are still fooled by this falsified
information ! Some even were hoodwinked into buying...

Moral : before believing and/or stupidly repeating the proposals of
others, verify for yourself, or verify it with REAL professionals!

Rodolphe Czuba

THE TRUE CLOCK OF THE MC68060 (the end of the liars ?)

Just a little demonstration with a FALCON, an HADES 060, and
GEMBENCH 4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030
and the 060.
For the 030 : 44 clock cycles.
For the 060 : 22 clock cycles (page 10-16 of the DATA BOOK !)
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on:
FALCON STANDARD 16 MHz : 100 % (normal !).
HADES 60 at 60 MHz : 767 %.

Here is the equation, no comment.
68060 at 60 MHz = (44/22) x (60/16) = 7.50 or 750 %

On the one hand, we have the theory with the DATABOOK (if some people
want to interpret the DATABOOK differently, we ARE LISTENING !) which
gives 750 and on the other hand, a real test on a machine which gives
767 !
So, the hypothesis for the 060 at 60 MHz is proven correct.
If the 060 was at 120 MHz, like some people would like us to believe,
the gembench test should have been closer to :

1500 = (44/22 x (120/16) !

REM : The BUS of the HADES 60 is CLOCKED AT 30 MHz !

5928. Coding auto summertime changes

Newsgroup: comp.sys.atari.programmer
Date: 1997-10-26 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <40609311_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 6229

Hi guys

Some DOS software and Windows software can automatically detect when
summertime etc. begins and ends. I'd like to do the same on my Atari.

The Supported DOS software will also change automatically if the 'GTZ'
environment variable is set correctly to:

GTZ=GMT0BST1,M3.5.0/01:00,M10.5.0/02:00

Can anyone tell me how a program interprets this variable?
It's the M3.5.0 and M10.5.0 bits that I don't really understand.

TIA,
Gary

Source record: 6230

This is probably a hopless thing, but if anyone can help I would appreciate it.

My father-in-law wrote an opera using an Atari computer hooked up to a synthesizer. I can get the details on the Atari model, but it is about 5 years old and uses a double density 720k floppy format with no hard disk drive.

Now there are two opera companies that want to perform the darned thing and he needs to get it into IBM PC format.

The way I see it there are two problems. First, getting the data from the Atari double density floppy onto a quad density disk in a format that IBM computers can read. He called a data conversion company in NYC and they basically balked at it due to its MIDI format. Second, translating the data. The software package he used has an IBM version and he has contacted them. Needless to say this was way beyond the capabilities of their Help Desk to handle, so they are ignoring him in the grand tradition of software Customer "Service".

I know- this is probably a hopeless task but I hope their may be somone out there who can help.

Kevin

No, as it is proprietary and thus would not work in many environments.
Instead, I fully support Christof's suggestion to use the Unix lpr stan-
dard, like I also mentioned in my other message here.

Please note with STinG you can use both the Midi port and any serial port
at the same time for TCP/IP networking. It's true there is no printer
client/server yet. But instead of trying to built a self-contained system,
I'd suggest to let STinG do the low level stuff, and instead concentrate
on the client/server functionality. You'd end up with much improved flex-
ibility (you can use Ataris or PCs running Linux for instance as either
clients or servers too; you can built bigger networks with many machines
and only one print server, instead of connecting only two machines; you'd
have additional services, like file transfer (FTP), and shared filesystems
later on), and yet do not have to bother with the low level networking stuff,
saving lots of work. Note the STinG and STiK application programming inter-
face is especially designed for use by programmers unexperienced in network
programming, therefore easy to use.

Yep. Those calls are defined only for ST standard video hardware. They do
not work with most other video hardware, like the Crazy-Dots or similar.

> Is it possible that I make some mistakes about the screen-base address
> or there is athers "standard" methods ?

The mere mistake is using these calls. They are XBios calls which only
supports standard hardware.

For being compatible with add-on video hardware you definitely need to
use VDI exclusively. VDI does not have any means to do screen flipping,
because many hardware add-ons do not have the hardware to make it possible.
So you need to stick to other methods (supported by VDI).

The atari disk drive hardware is compatible with the PC hardware -
both machines can read & write data from the other. The problem lies
in the software and in this case the fault lies with the PC being much
too fussy over what is acceptable. Both machines can read and write
double density floppies which use 80 tracks, 9 sectors per track.

If you still have access to an atari it is well worth formatting a
double density disk (720k) on the *PC* and copying the files off the
atari floppy onto the PC formatted floppy (don't do it by dragging one
ST drive icon over the other - iirc this causes a format). The PC
should then be able to read them, provided the atari originally
formatted them in the standard double density format and the midi
package hasn't got in on the act.

If this fails it could be for a number of reasons and I assume time is
of the essence here. All a data conversion company really needs to
know is that the atari floppies are *physically* and *logically* PC
compatible. An atari floppy ...

a) can have any number of tracks (typically 80-83).
b) any number of sectors per track (typically 9 or 10).
c) any number of sides (it'll be 2 though).
d) 128, 256, 512, 1024 bytes per sector. (it will be 512 though).
d) 99% compatible bootsector.

... if the crucial info in the bootsector is interpreted correctly the data can be transferred.

Btw, if the atari disk was formatted from the standard atari desktop then it will already match the PC double density format exactly, except for a couple of irrelevent bytes in the bootsector. It's these irrelevent bytes which cause the PC to think the floppy is corrupt. A low level dumb copier should be able to produce a copy whereupon the copy's bootsector can be patched or overwritten with a PC one - don't do it to the original!

1. If the Atari is still working, you can copy the disk onto an IBM
formatted DD disk.
2. As far as the MIDI proprietary format, the easiest thing would be to
MIDI up the Atari to an IBM as Master /Slave and play the Atari while MIDI
recording on the IBM. (or a keyboard that has sequencing capabilities).
3. Many of the Atari sequencers were able to save as a SMF, in addition to
their own format. (Though you may lose some information).

5936. Re: Coding auto summertime changes

Newsgroup: comp.sys.atari.programmer
Date: 1997-10-27 00:00:00 UTC
From: gryf@hrzpub.tu-darmstadt.de
Message-ID: <631vj8$9gq$1@sun27.hrz.tu-darmstadt.de>
Source record: 6237

Hi!

In article <40609311_000003_OASIS_NEWS@the-gap.demon.co.uk>,
gary@the-gap.demon.co.uk (Gary Priest) writes:
> GTZ=GMT0BST1,M3.5.0/01:00,M10.5.0/02:00
>
> Can anyone tell me how a program interprets this variable?
> It's the M3.5.0 and M10.5.0 bits that I don't really understand.
M3.5.0 stands for "5th sunday in March", which in fact means the last
sunday in March. The 3 is March, 5 is the week, 0 is the weekday,
where 0 is Sunday, 1 Monday, and so on.

In the same manner, M10.5.0 represents the last sunday in October, which
is the date the summertime ends.

I've included the complete documentation for the $TZ-format, as this is
not the only rule format for the swichting dates.

Hope that helps ...

-- cut here --
TZ TZ sets time zone information. TZ can be set using the
format:

[:]STDoffset[DST[offset][,rule]]

where:

STD and DST Three or more bytes that designate the
standard time zone (STD) and summer (or
daylight-savings) time zone (DST) STD is
required. If DST is not specified,
summer time does not apply in this
locale. Any characters other than
digits, comma (,), minus (-), plus (+),
or ASCII NUL are allowed.

offset offset is the value that must be added
to local time to arrive at Coordinated
Universal Time (UTC). Offset is of the
form :

hh[:mm[:ss]]

Hour (hh) is any value from 0 through
23. The optional minutes (mm) and
seconds (ss) fields are a value from 0
through 59. The hour field is required.

If offset is preceded by a -, the time zone is east of the Prime Meridian. A + preceding offset indicates that the time zone is west of the Prime Meridian. The default case is west of the Prime Meridian.

rule rule indicates when to change to and from summer (daylight-savings) time. The rule has the form :

date/time,date/time

where the first date/time specifies when to change from standard to summer time, and the second date/time specifies when to change back. The time field is expressed in current local time.

The form of date should be one of the following :

Jn Julian day n (1 through 365). Leap days are not counted. February 29 cannot be referenced.

n The zero-based Julian day (0 through 365). Leap days are counted. February 29 can be referenced.

Mm.n.d The d day (0 through 6) of week n (1 through 5) of month m (1 through 12) of the year. Week 5 refers to the last day d of month m. Week 1 is the week in which the first day of the month falls. Day 0 is Sunday.

time Time has the same format as offset except that no leading sign ("-" or "+") is allowed. The default, if time is not given, is 02:00:00.

While the STD field and the offset field for STD must be specified, if the DST field is also provided, the system will supply default values for other fields not specified. These default values come from file /usr/lib/tztab (see

tztab(4)), and, in general, reflect the
various historical dates for start and
end of summer time.

Source record: 6238

Hi everyone,

i hope that someone can help me in this matter:

In my time as an ST-User, I did a program in OMICRON BASIC (which
was delivered with the 1040 ST for a certain time) In the manual,
a compiler is mentioned, but it was too expensive for me at that
time...

Now, as PACIFIST and all the other emulators emerge, I'd like to
make the compiled program available on the net, but first I need
the compiler !

Does ANYBODY know something about it ???

Please, as I do not read the newsgroups often,
MAIL your answers to: daegest@fh-trier.de !!!

THANX ALL YOU ST-GUYS !

I wrote a program to do this a long time ago. You can put it in your
AUTO folder and it switches the clock of your computer to daylight
saving time and vice versa automatically.

It used to be on cnam.fr, Utilities/Clocks/dstint.lzh, but I don't
know if that ftp site still works.

I can also mail it to anyone interested. Please indicate if you want
uue or base64 (MIME).

In article <40609311_000003_OASIS_NEWS@the-gap.demon.co.uk>
gary@the-gap.demon.co.uk (Gary Priest) said:-

>The Supported DOS software will also change automatically if the 'GTZ'
>environment variable is set correctly to:
>
> GTZ=GMT0BST1,M3.5.0/01:00,M10.5.0/02:00

It can be TZ (and not GTZ) if all used software recognise the
extended syntax. If some programs don't and get confused, you can set a
simpler TZ=GMT0BST for them, and a complete GTZ for the others. A modern
app should getenv("GTZ"), and if there is not then getenv("TZ") to read
the timezone informations.

BTW AFAIK this syntax is not a DOS stuff, but a Un*x one, also used
by some DOS, TOS, MiNT or others applications. And there is a problem
with the values you have given for Great Britain, the "1" just after
"BST" should be a "-1" (or nothing at all).

Here in France (and most central Europe countries) it should be
something like "TZ=MET-01:00MEST-02:00,M3.5.0/02:00,M10.5.0/03:00". The
values are: std offset[dst[offset][,StartRule[/time],EndRule[/time]]]

- std (MET here) is the standard timezone name (for winter time).
- offset (-01:00) is the value to add to local time to get GMT. You can
omit leading zeroes, omit minutes or add seconds (-1 and -01:00:00 is
the same offset). For positive values you can set a "+" in front or not.
- dst (MEST) is the summer timezone name. If it's "DST" the name will
be "MET DST". If there is no name, there is no summer time.
- offset (-02:00) is the same as the first offset but for summer time.
If it's omited it's automatically one hour ahead of standard time, just
like nearly everywhere AFAIK.

The transition rules now: the first one is the to-summer rule, the
second to-winter. If a rule begins by an M (as in "M10.5.0") the 3
numbers are the month (10=October), the week (5=always last), and the
day (0=Sunday). The time is in current local time, so it's in standard
time for the to-summer transition rule, and in summer time for the
to-winter rule.

So the above french TZ values means zone named MET in winter, and
named MEST in summer from last Sunday of March at 2:00 MET (1:00 GMT) to
last Sunday of October at 3:00 MEST (1:00 GMT).

A good Great Britain TZ value could be "GMT0BST,M3.5.0/1,M10.5.0/2"
I think, for USA Pacific time "PST8PDT,M4.1.0/02:00,M10.5.0/02:00", for
New Zealand "NZST-12NZDT,M10.1.0/2,M3.3.0/3", and for Newfoundland

"NST3:30NDT1:30" (I don't know the transition dates).

This environment variable should be read and parsed by the time
library of your compiler, but some don't do it like Pure C for
example... It is used to get time(), calculate localtime() and gmtime(),
etc... from a system clock always in local time. It doesn't change the
system clock.

To change automagically the system clock when it is needed at the
correct date, there is a really nice little AUTO program called DSTINT
1.4 by Jos den Bekker. It has just worked here yesterday to correct my
clock when I powered on my Falcon, I didn't need to do anything by
hand... It was at ftp.cnam.fr, should be at ftp.lip6.fr, but AFAIR Jos
never uploaded the last revision.

Bye! Bruno.

Not to be-labor the networking thing... but I was wondering if anyone knew of a networking package that:

1. Runs on both Falcons and Mega STe's
2. Actually uses the LAN port instead of the MIDI port

Anyone?

A serial or parallel will suffice I suppose, but MIDI is out because my Falcon is used or D2D and MIDI...!

There is a German package callled MidiCom which will allow you to
network upto seven Atari computers via either the MIDI, Serial or
LAN Ports.

System Solutions is the UK supplier for MidiCom. There is also a
German demo version which allows you to network your Atari's, but
only allows you to share drives A & C. You can find this demo on
many Atari FTP Sites.

MiNT-Net. It'll require a reasonable amount of RAM though, so the Mega might
struggle - 4mb is enough though.

> 2. Actually uses the LAN port instead of the MIDI port

AIUI (yes, I haven't tried it), MiNTnet will support the LAN port - it is after
all it is simply another serial port (at different speeds, of course).

> A serial or parallel will suffice I suppose, but MIDI is out
because my Falcon
> is used or D2D and MIDI...!

MiNTnet supports RS232, parallel and MIDI as well.

You can use STinG to run a network with LAN ports. It however is only used
for connecting two machines, to add others you'd need to use other ports
too. The Mac-like bus structure LAN isn't available with STinG.

From: odonnllb@indigo.ie
Message-ID: <878522165.790@dejanews.com>
Source record: 6251

I want to pass parameters in registers to a routine written in assembly. As far as I can make out from the (execrable) manual the format should be: extern void __asm getmove(register __d7 int, register __d6 int, register __a5 long, register __a3 long); among the declarations, then getmove(oxy, routecnt, wallf, fightf); where it's called. This apparently compiles if I set rb in the Compiler options, but Clink says Not a valid object file. And it took a lot of experiment to get it compiled. What am I still doing wrong? I am already linking in an assembly o-file, and I probably could have made a workaround envelope routine in a few minutes, but I want to use the __asm facility; it might be useful elsewhere. Please respond by email, as I wouldn't be using DejaNews for posting if I had any confidence in my ISPs Regards Brian O'Donnell odonnllb@indigo.ie odonnllb@tcd.ie Both adresses work; both news servers suck

I was wondering if Clayton Walnum is still involved into
'C' programming on the Atari platform?

He authored a really good series on 'C' programming for the
Atari platform is ST-Log, in the early 90's and eventually
compiled it all into a book called "Cmanship Complete".

While his book is now somewhat outdated (in regards to any
multi-tasking considerations) this is still THE book about
programming in 'C' for the Atari ST/TT/Falcon.

What could/should be done is an HTML version on CD-Rom, to
help those just getting started into programming their ST;
the same thing that was done for The Atari Compendium some
2 years ago.

However, first, we have to find the man himself for proper
authorizations and, if he's so inclined, to update the info
contained in his book.

Clayton, if you are reading this, please respond! ;-)

Anybody interested in contacting Clayton could drop by his web page at:

http://www.connix.com/~cwalnum/

Or email him:

cwalnum@connix.com

It seems he wrote a further three books on Atari programming:
The ST Assembly Language Workshop
AES Quick Reference
VDI Quick Reference

All of these and Cmanship were self-published in the States. If he were to authorise a public domain version of his works, I would personally favour an ST Guide version or at least an HTML version distributed over the net or by floppy as I don't have a CD ROM drive :-(

What machine?

STE, TT, Falcon - easy. (for Falcon details, check my WWW pages).

STfm, not so easy, but possible... it'll require linking with an assembly routine which will install itself on interupt (allowing execution to continue, but slowly).

There was also The ST Assembly Language Workshop - Vol. 2 which was
distributed as shareware. It wasn't printed. When I registered mine
Clayton sent a note saying that I was only the 5th person to register.
This was about 3-4 years ago, hopefully he got more registrations.

It's only possible on a machine with a DMA sound system, eg TT, STE of
Falcon. On other machine, it's also possible but you have to build
interrupt-routine that slow-down the machine and that can be only done
in assembly langage.
In C, using the DMA sound system, you just have to laod the digit, set
correctly the sound system, then send it the adress of the sound and its
lenght and the system will play the sound itself.

Regards

The best way is to use the DMA sounds capability built into the newer machines (since the STE). Also, you can use SAM (System Audio Manager) which makes the process even easier, and also allows the possibility that the software might work on other machines that don't have DMA sound, if a version of SAM was made to support the sound capabilities of those machines. Use waveplay() to play sounds with SAM.

The Atari Compendium is a good place to look for further information - there you can find details of waveplay() and the DMA sound.

Yes, I have a TT030 (DMA sound system)
My problem is understand if this method can play the digit without froze
the system... (in playback)

Thank you

Yeah, when I registered, the note he added on the receipt made it sound like
he hadn't had much of a response. A real shame, as it was those two
Assembly Language Workshops which got me programming GEM assembly programs.

5966. Component Manager

Newsgroup: comp.sys.atari.programmer
Date: 1997-11-07 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <63v1dd$2u2@balaena.bio.vu.nl>
Source record: 6267

Does anyone know if James Cox is (still) reachable by Email or
reading this newsgroup (in which case: Hi :)
I have a question regarding his wonderful Component Manager,
which I can't use because he forgot to include some info
on how to use the component loading utility. I don't know
the format of the command files it uses.

For anyone who doesn't know what I'm talking about:
The component manager is a small MiNT program (about 4k)
which enables Atari users and programmers to make use of
dynamically loadable components (similar to DLL's, Dynamically
Linkable Library's).

I've written a GEM ui extension component
(more on that later, when I've finished debugging & testing the thing)
to go with an art program I'm working on, but I can't test it because I
can't load the damn component.

Hello again,

I'm going to really start publicing ICTARI properly now.

For those who don't know, ICTARI is a disk-zine / user group
for Atari programmers. You can read, download and contribute
to the zine on the WEB:

http://www.elis.demon.co.uk/ictari/ictari.htm

If you know any keen programmers not on the 'net, I'd be
grateful if you could print this out and give them a copy.
Why not take it to your local user group meeting ?

Thanks,
"Augeas"

useful programs for programmers etc, etc. The service itself is completely free, members send us a blank disk each month and the postage (or the cash equivalent) in return for next month's disk.

If you are an experienced Atari programmer, the group would very much value your programming expertise, however, this does not mean that we would expect you to provide programming articles, tips, etc, for each disk. If each member only contributes two articles a year we would have enough material to fill a disk each month, and if you decide to join the group we would hope that you could occasionally send in some contributions for the magazine. The sorts of material we try to publish are programming techniques, useful sub-routines, C functions, BASIC procedures, MACROs, etc, which would be of interest to other members. You may also be able to help other programmers with software problems and there may be other members who could help it you with a software problem that you have, after all, even experts don't always have it all the answers.

If you are a beginner to programming or are just starting to learn a new language we can probably help with any software problems you have as we often run tutorials on various languages and programming techniques. If you have any programming queries, please send them in (on disk if possible) so that other members can hopefully provide a soloution for you.

We trust that you will consider becoming a member of the group and provide some useful input to the magazine occaisionally. If you are interested perhaps you would fill in and return the enclosed questionnaire to us at the above address. To recieve the next issue you will also need to send a double sided disk together with two 2nd class stamps or 75p cash for each month. Please return these as soon as possible so that we can place you on our mailing list for the next issue which will be despatched about the 15th of the month. The questionnaire and latest issues are also available from the ICTARI WEB page. Cheques or postal orders should be made payable to Mr G. R. Greenway. Back issues are also available for 1UKP each.

If you decide not to become a member we would be grateful if you would pass this letter and questionnaire on to someone who may be interested.

We hope that you will agree to join the group, we are sure you will find something of interest on each disk and for just a few pence a month can you afford to miss out on the chance ? We look forward to hearing from you in the near future.

Well if someone could talk him into releasing all those books in one
form
or another it would be cool. Those AES and VDI books wouldn't be to bad
either. Also a CD-ROM version with both a html version and the original
version for printing out on paper your self would be cool. A good reason
to finaly get that CD-ROM!

The DMA doesn't use the processor. So the playing of a sound with DMA is
totally transparent for the system, it don't freeze it.

5976. Changing serial bit number and parity

Newsgroup: comp.sys.atari.programmer
Date: 1997-11-09 00:00:00 UTC
From: Jean-Michel MERCIER <jmmercier@compuserve.com>
Message-ID: <01bced5c$d38341a0$LocalHost@grossevache133>
Source record: 6277

Hi,

I would like to know if there is a __clean__ way
to setup serial parameters (esp. length and parity)
in a way that is independant of the hardware ?

I suppose that the XBIOS 0x0F call support only the MFP
so it won't work with the ST's 8530....

It should also be compatible with HSMODEM and others
hi-speeders.

Thanks for any pointers.

Sincerely,
Jean-Michel MERCIER.

5977. TT SCC clock mode

Newsgroup: comp.sys.atari.programmer
Date: 1997-11-09 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <d93_9711091821@conchbbs.com>
Source record: 6278

Looking over my hardware docs, I see that Modem 2 uses a 2.4576 MHz
clock (RTxCB), and that Serial 2 uses a 3.672 MHz clock (RTxCA) .
In clock mode 16 (asynchronous) this gives the following baud rates:

```
TC Modem 2 Serial 2
-- ------- --------
0 38.4 K 57.4 K
1 25.6 K 38.25 K
2 19.2 K 28.7 K
```

It is also possible to use PCLK (8 MHz):

```
TC Baud
-- ----
0 125 K
2 62.5 K
3 50 K
6 31.35 K
8 25 K
```

However, these do not correspond to the figures I've seen here
(presumably from HSModem). Am I missing something, or is it that
one need not match baud rates precisely?

AFAIK, the old version where the patch works is a non-BFD based linker.

I am working on BFD support for Atari ST binaries, but this may take some
time ...

>one need not match baud rates precisely?

You don't need to mess with clock rates. Disconnect pin-32 (RTxCB)
from the circuit-board and solder a short wire to pin-13 (RTxCA).
This will allow Modem-2 to use 57600, 115200 and 230400.

You then need to change a parameter in HS-Modem's SCC.PRG config
to have it provide the new baudrates. (HS-Modem assumes what are
the "normal" baudrates using the TOS version)

Afaik, the TT is the only SCC machine with non-standard baudrates
on Modem-2. Both the MEGA-STE and Falcon have 57600 and 115200.

However, the unusual baudrates are not such a dumb choice. Read
texts on "The TT030 Homepage" at my URL to learn more about these.

Yours,

You need to Fopen the port (Fopen ("U:/DEV/MODEM2", FO_RW); turn the slashes into double backslashes in C), then use Fcntl to modify the parameters. Use their corresponding filenames in DEV for the other ports.

With neither HSMODEM, nor MiNT, nor MagiC there is no unified way to set all the parameters for all the interfaces. For some parameters, you can use Bconmap to map the port to AUX:, then use Rsconf, but that only works with TOS 2.0 or higher.

> I suppose that the XBIOS 0x0F call support only the MFP
> so it won't work with the ST's 8530....

There is no ST with 8530 (unless you've put one in). It's used only in the Mega STE series, the TTs, and the Falcons.

But the XBios 0x0F (Rsconf) does work with those too, if you mapped the 8530 port to AUX:. Note not all of the Rsconf parameters are valid in that case.

Generally I strongly advocate to not use such code in a user application. Such setup stuff is the task of specialised tools, like the MODEM.CPX or SERIAL.CPX. Note my SERIAL.CPX supports all the HSMODEM features. So I'd suggest to not care about the settings in your program code, and simply use those the user has chosen with the CPX before running your software. It will save you a lot of work, and removes lots of opportunities to spoil compatibility with other machines.

If you wanna provide a complete package to the end user, pack the SERIAL.CPX into the archive that you distribute.

Cheers Peter

OK, I understand...
Finally I developed a little C routine: good result!

Another thing: in the Atari Compendium book there is a waveplay() function
to use with the SAM (System Audio Manager) by Atari.
OK...!
But WHAT IS ?

> to use with the SAM (System Audio Manager) by Atari.
> OK...!
> But WHAT IS ?

What is SAM? well, its a program which Atari wrote which allows you to attach sampled sounds to system events (such as windows closing, crashes etc). This works on all DMA sound based machines with TOS 2 or greater. It supports 16-bit on the Falcon.

SAM also allows programmers to register their programs as "SAM Aware Applications" via .SAA files, allowing them to play user-defined sounds which are assigned through the same interface as SAM's system sounds - to create a .SAA file, us KP SACK, available from my WWW pages.

The final piece of functionality that SAM provides is the plain Waveplay() function, which provides a simple interface to playing samples, useful for application programmers who do not wish to fiddle with the DMA registers themselves.

References:
http://www.zetnet.co.uk/jacquesa/kpp/kp_sack.html
http://www.zetnet.co.uk/jacquesa/programming/waveplay.html

note: the text on the KP SACK page seems to be out of date - SACK 1.0 has been released for a while, as has the patched version of SAM (1.3) - both of which are linked to at the bottom of the page.

It work fine with every kind of serial interface because
the driver should emulated the mfp parameters to setup
the serial port.

> It should also be compatible with HSMODEM and others
> hi-speeders.

HSMODEM install all what you want to setup serial port
and he has some documentations to explain it.

I can't see how it can setup anything else than the original
MFP port as there is no parameter to select which port you
want to setup ...

Yes,

I found the U:\DEV\portname and Fcntl tricks and ported them
to GFA [if anyone is interrested...]

By the way, the U:\DEV\... path exist in TOS or is it a HSMODEM
add-on ?

Hello everyone,

Yesterday I finally succeeded to install GNU 2.7.2 on my falcon.
Unfortunately, with test compiles of C++ the linker seemed to have
problems with handling exceptions.

Anyone can help me out with this? Do I need other libs for this than the
G++.olb?

greetz,
Vince

5989. Running released - 13.11.1997

Newsgroup: comp.sys.atari.programmer
Date: 1997-11-13 00:00:00 UTC
From: <>
Message-ID: <64f4ne$dhl@winx03.informatik.uni-wuerzburg.de>
Source record: 6290

```
Hi everybody !

Finally, here it is ...

Running is released.

This means that this mailing list has lost his intention and will be
deleted right after sending this last message.

-----------------------------------------------------------------

Well, we have broken a lot of promises and deadlines ... a lot of
people thought we would never release this game. But the RDT team
never thought of canceling the project and succeeded to create an
outstanding game for the ATARI Falcon computer system.

For further information and some screenshots please visit our page
at:
http://stio1.fh-wuerzburg.de/student/i381

For other questions, please email to:

kx0029@kulmbach.baynet.de RDT HQs
i381@stio1.fh-wuerzburg.de Public relations HQs

-----------------------------------------------------------------

We think that we have done the best we can. Now it is time for the
ATARI Falcon community to show their respect and fairness and spend
some money in buying this great game. We spent a LOT OF TIME and
MONEY to get things right - support us and don't be a pirate !!!

The prices are very modest, and there are several distribution
partners providing support and easing the ordering procedure for
you. Please carefully read the next lines ...

---------------- Distribution in Germany -------------------------
```

Deutschland. Running kostet im Deutschlandvertrieb 59 DM.
Bestellungen k�nnen schriftlich oder per Email get�tigt werden.

```
Schriftlich bei:

RDT Volker Konrad
Georg-Thiel-Str. 13
D-95326 Kulmbach
```

Bei der Bezahlung ist dabei m�glich:
- Vorkasse 59 DM(auch m�glich: 60 DM - die Differenz von 1 DM

liegt der Bestellung sp�ter bei).
- Eurocheque �ber 59 DM.
- Bank�berweisung von 59 DM an:
RDT Volker Konrad
Sparkasse Kulmbach
BLZ 771 500 00
Kontonummer 810655

Bitte �berweisungsquittung (mit Tagesstempel der Bank)
mitschicken (oder Kopie), ansonsten warten wir die
Gutschrift ab.
- Per Nachnahme. 59 DM + 3 DM f�r Postzustellung per Nachnahme.

Email an:

kx0029@kulmbach.baynet.de

Hier ist nur m�glich:

- Per Nachnahme. 59 DM + 3 DM f�r Postzustellung per Nachnahme.

---------- Distribution in the UK -------------------------

UK. In the UK Running is available for 20 UKP + p&p. Mailorder at:

Denesh Bhabuta
CyberSTrider
PO Box 2023
Wickford
SS12 9RX, UK

Some ways of payment:
- Eurocheque
- Cash in Pounds Sterling, Dollars and DM.
- International money order payable in *Pounds Sterling*

For further details please visit Denesh's homepage at:
http://www.cyberstrider.org

or send him an email:
denesh@cyberstrider.org

---------- Distribution in Australia/Newzealand ------------------

Australia and New Zealand. Running is available for A$ 50 + A$ 5 p&p.

Order Running at:

Anthony Green
Fujination
GPO Box 1190
Hobart TAS 7001
Australia

For details please visit Anthony's homepage at:
http://www.intelitec.com.au/fujination/

or send him an email:
ac_green@tassie.net.au

---------- Distribution in France ------------------

In France Running is available soon.
The negotiations are still running and hopefully will be finished
next week. Please visit our homepage (see above) about the news.

---------------- Distribution in the USA ---------------------

Our partner didn't answer for some weeks. We hope he will get
online again soon.

------- Distribution for all other euorpean countries --------

Europe. Please order via postal mail at:

RDT Volker Konrad
Georg-Thiel-Str. 13
D-95326 Kulmbach
Germany

And about the prices:
- Cash 65 DM - use registered letter !
- Cash $ 40 - use registered letter !
- Eurocheque, Value 65 DM.
- European money order, value 65 DM.

Important: you have to takeover all banking transaction fees!

------- Distribution for all other countries worldwide --------

Rest of the world. Please order via postal mail at:

RDT Volker Konrad
Georg-Thiel-Str. 13
D-95326 Kulmbach
Germany

And about the prices:
- Cash 70 DM - use registered letter !
- Cash $ 45 - use registered letter !
- Eurocheque, Value 70 DM.
- International money order, value 70 DM.

Important: you have to takeover all banking transaction fees!

-------------- End of distribution information ----------------

Some people asked us to release a multiplayer version or to
release our level editor.
We are willing to deliver a multiplayer version with some
special levels. However, this depends on your feedback, i.e.

the Running sales. We think that we don't have to give you all at once. We have done our part - now it's your time to motivate us again.
The level editor runs under Windows95/NT - this reduces the interest for all ATARI users, we think. But if there is still interest in the editor, we probably release it ...

Ok, time to say goodbye and hopefully welcome you as our customer soon.

Have fun with Running - it's great.

Yours,
RDT team, 1997.

Yes, there are problems with GFA-Basic under MagiC or Geneva, but they can be solved. Search for Vegard Hofs�y�s homepage (author of Face Value), he has some patches.

```
> Second, what are the advantages/disadvantages of using Magic and Geneva?
```

The obvious disadvantage is that it uses some memory. Geneva use a bit less than MagiC, but unless you have TOS 2.06 I�d recommend MagiC over Geneva.

If you have 2.06 then it�s really just a matter of taste. Geneva is more compatible if you use midi-programs or older apps, but MagiC is slightly faster.

```
> Third, is Geneva still available and, if it is, where from?

In UK Geneva is available from Titan Designs.

Er, you sit and type some code in, as you would anywhere else.

> Is it like writing a CD? I am a
> programmer with an Atari (ancient though). Is there a kart that lets you
> program other karts?

Ah! you mean a Jaguar game, right? or Lynx? or the old 8-bits?
Not the ST->Falc series, I assume.

Seriously though... for the Jaguar at least, you need a complete development system (either Atari's own, which you probably cannot get anymore), or a modified Jaguar (the "Jaguar Server") and an Atari computer. However, with the Jaguar Server option, you will not be able make carts, as they are encrypted, and Atari have never (AFAIK) released information about the encryption algorithm used - so Jaguar Server games can only be played on other Jaguar Servers (much like the Playstation Yuroza)

I hope this is of some use...

You can get most patch programs from Columbus Soft, Germany
mailto:christof_schardt@of2.maus.de

If using MagiC I�d advise you to use Ergo!-pro. That�s an IDE for GFA-Basic and Face Value, also available from Columbus.

There is an FAQ about such questions (only in German). I could post it here if you whish.

To all Face Value/GFA-programmers: have a look at my website, there are some links to Face Value-related sites (files -> Face Value FAQ/Face Value UTIL)

Hi, all. I would like to get as much info about the Crazy Dots line of graphics cards. I know that there are two versions, but suspect there are more? I don't know much about these cards, so feel free to input all you might know about them. I specifically want info about the ones for use with a TT.

Thanks..

Hi There

I'm a long time user of the ST ,Have s 2 meg 520STe with a colour
monitor and a 240meg HD and the one piece of software I have been
looking for all these years is the multitasking software package GENEVA
can't seem to find out who sells it,any idea where I could pick it up
and how much?

any reply would be really appreciated

Bill

I want to do some programming with MIDI on the ST....i'm looking for some language that reads the incoming data on the midi port (and that's also able to send ofcourse...)

Can anybody help me? What should I use?

David Bolt (dbolt@my-ste.demon.co.uk) wrote:

: First, are there any problems using GFA basic with Magic or Geneva? If so,
: what and can they be easily solved?

Just get the GFA patches and don't forget to free any memory
you don't need at the start of the program
(eg. use RESERVE <new amount of mem>).
And you'll have to write clean GEM code. (don't use GFA's window routines
for instance, although I don't know why...) And don't write into memory
that doesn't belong to your program.

: Second, what are the advantages/disadvantages of using Magic and Geneva?

Advantages: you get, among other features, multitasking and cool GEM extras,
and (at least with MagiC) a nice speed increase.

Disadvantages: Takes up a bit more memory than plain TOS+GEM, shouldn't
be any problem with 4 Mb though...

You can use any langage. Just take a;look at gemdos or Bios function in
order to read, write to midi port. Notice that reading and writing
function of the TOS need the port to be OK to receive or read. Meaning
that if you try to read as nothing is coming, your software will waut,
wait, wait.... until someting really came from the port! So, use other
Bios or gemdos function in order to ask "Is there something comin?"
before you try to read. That's the same for writing.

You're thinking of either the 2600, 5200, or 7800 game machines.

>It works only with a regular tv, two joysticks, and a black box where
>you put the kart in.

Then it's the 2600, with the Basic Programmer cart, unless the Jaguar came
out with a programming kit.

The next item from Atari that could be programmed using Basic was the 400
with 16K, a 410 or 1010 Recorder, and the Basic cart, together with the
Programmer's Toolkit, if I'm remembering the name right. Way back then,
around 1981, when I bought it, the total cost was about $300. Today, it's
worth maybe $10 or less.

Sorry, you must have missed my sarcasm. :)

"Atari" covers > 7 different computers/consoles... For the machines that
do not have keyboards, you usually have to use another computer to develop
on - getting hold of a development kit for a console, is not easy...

> > > Is it like writing a CD? I am a

Hmm... sounds like an 8-bit to me, but depending on what you call a joystick,
it could be a Jaguar, I suppose... I dont know anything about the old 8-bit
machines.

6015. Atari Dev. Info

Newsgroup: comp.sys.atari.programmer
Date: 1997-11-26 00:00:00 UTC
From: bitbrker@www.ionet.net
Message-ID: <880532937mnewsbitbrker@www.ionet.net>
Source record: 6166

Greetings,

We are currently gearing up software development for the
following hardware platforms:

Atari Falcon/TT/STe, Amiga, PC, Mac, Acorn A7000+/Risc PC

Regarding the Atari systems, we are bound to require the following
minimum platform:

At least 020, 256-color mode, 8-bit DMA sound, hard drive

Of course, the Falcon version will have some improvements.
It is my current task to research the capabilities of various
graphics cards available for the TT/STe as well as the CPU
upgrades to determine their viability as games development
targets. The TT clones on the market are also being targetted.

In addition, we are seeking the technical OS developer's
manuals that Atari released, including Falcon information.
We have already gained access to DSP 56001 data book, a 68020+
assembler, a MIDI synth, and the "Atari Compendium" reference.
However, this is not sufficient as we require much more TOS
data and especially data on the networking ports and such.
As Atari was absorbed by JTS, we cannot get data from them.
We would certainly appreciate any info or Atari users could give
us. We would also like more information about "C-Lab", the company
that has the rights to the Falcon.

My sincerest thanks,

Tm2, Atlantis Software Development/HD

There are no 020s in the Atari world! It looks like your minimum setup
is the Falcon 030 and TT.

>

If you want to sell the games, you might want to target the widest
possible target. This probably excludes add-on graphics cards as they
are widespread.

>

This should all be in the Compendium. Don't know where you can find this
though. An atari dealer might have still have it.

Certainly not ! The PAK was one of the most popular projects of the c't magazine,
and I guess even in the Atari world there might be still one to two hundred
of them.

Greetings all, I've just completed a small GEM password programme which takes advantage of the #_AUT feature in MagiC. Although it works well, it's easy to delete it via the Task Manger (alt+control+esc).

Does anyone have any idea as to how to disable the Task Manger in C ??
My compiler is LC 5.60.

Thanks,

All righht, all right, there are 020 based machines... but the guy said
020 and DMA sound, sound I guess you don't qualify anyway.

How I like having th last word ;-)

You can get a graphics card suitable to produce almost any display you like. On Atari systems with inbuilt graphics capability, however, most people don't use a graphics card.

: In addition, we are seeking the technical OS developer's
: manuals that Atari released, including Falcon information.
: We have already gained access to DSP 56001 data book, a 68020+
: assembler, a MIDI synth, and the "Atari Compendium" reference.

The Atari Compendium should contain virtually everything you need to know.

: However, this is not sufficient as we require much more TOS
: data and especially data on the networking ports and such.

What mora data could you want? TOS is covered entirely in the Compendium. I don't know what you mean exactly by networking ports. If you mean the "LAN" port, this is simply a serial port (as explained in the Compendium).

To have some other kind of network interface you would need to get an additional card. The method for accessing the network depends on the software being used, but you could look at STiNG and MiNTNet since these seem to be the most popular packages that support more than just SLIP or PPP for the internet. You could only use one of these packages if a driver was written for it for the network card being used, of course. A few drivers for, I think, VME network cards are included with MiNTNet.

: As Atari was absorbed by JTS, we cannot get data from them.
: We would certainly appreciate any info or Atari users could give
: us. We would also like more information about "C-Lab", the company
: that has the rights to the Falcon.

C-LAB makes a few Falcon clones, but they have not really improved them at all. They are in a new case and have a few minor modifications done, that's all.

Terry,

What type of error message? I can't type in the whole Atari Compendium! But if you have access to one, that is probably the most complete resource that I have seen.

Bud,

Well, I have a whole new set-up here: TT, Magic, NVDI, Nova card -
I have no prior experience with any of these items. Basically, I'm
wondering if there is an online document listing the extended error
codes. I've just recently started actually doing any programming on
it, so at the moment, system errors are the most important thing.

For one specific example: "Program returned 68000 Exception error -
Error -69" - my references only go up to error -64

Thanks,
Terry

>
> What does this program do and are you releasing it?

It's a simple password programme which stops access to the desktop until the correct password/key is typed. It uses BubbleGEM, so it means the programme is non-model, and displays a message using BubbleGEM if an incorrect password is entered. After the 3rd failed attempt it locks up the computer. It also logs all attempts with time & date plus the attempted password to a file.

I'll upload it to <ftp.funet.fi> and <ftp.cs.tu-berlin.de> once I've finished the docs, there's not to write, I've just been a little lazy and I hate typing. ;-)

6039. Blitter programming

Newsgroup: comp.sys.atari.programmer
Date: 1997-12-03 00:00:00 UTC
From: bullenfc@dcs.gla.ac.uk
Message-ID: <663uli$7or@singer.cent.gla.ac.uk>
Source record: 6190

Hello! In the Atari blitter manual there is a section that says the blitter can do bitmap rotation with recursive sub-division. Does anybody know how to get the blitter to rotate bobs? Maybe it only works for 90 degree rotations? Anyway if anybody can shed some light on the subject I would appreciate it.

My last bob routine (soon to appear as the intro in the new issue of PB) can mask and or 31 32*30 2 plane bobs a frame with clearing on a standard Ste and it could be optimised further. I wish the Ste blitter would and then or a word in 8 cycles instead of 24 cycles like the Amigas one :(

C-ya!

From: dklugh@iwaynet.net
Message-ID: <66bupq$5kr$1@triglav.iwaynet.net>
Source record: 6096

I downloaded a "Space War" type game and the programmer talked about how he used his own sprite routines instead of the TOS ones.So does what are the capabilities of ST sprites and why would you use a TOS sub-routine to access them.Does TOS emulate sprites?
Are they like the Atari's Player/Missile graphics (which aren't technicaly sprites) or like Commodore's MOBs?

Hey ye all,

I know this is not the place to post this but I always post to
this new group with GFA questions and find someone has the answer every
time. Jeez atarians must be the samrtest people in the world :)

Anyhow I've just been given an old relic, an Hewlett Packard 286,
Go ahead laugh but it was free and I don't have any other DOS operating
system machines, all atari's. So on with the question.

I don't have a mouse for it but I've dozens of atari mice kicking
araound. How come it won't work with the 286. Does anyone know how to
re-wire the mouse to woek the 286?

Thank's
Scott.

I'll have a go at remembering the version numbers of the various TOS
versions I've used/interfaced with.

(I had a copy of the info in a _very_ old Toolbox I hacked/wrote
[1992-ish] - so I could compare and then flag "unknown" TOS/hardware - but
this list is now corrupted and source is unavailable (corrupted also).

> > >
> > > TOS Date GEMDOS AES
> > > -----------------------------------
> > 0.99 -1985

I used to have a copy of Disc TOS (1.00), but have lost it. I faintly
recall GEMDOS 0.13 and AES 1.0 - but don't quote me.

> > > 1.00 06-02-1986

1.00 11-20-1985 0.13 1.xx ROM (November 20th, 1985)

Can't recall the AES version for the UK TOS 1.0 ROMs - it's probably 1.10
or something similar)

> > > 1.02 04-22-1987

1.02 04-22-1987 0.13 1.20 ROM (April 22nd, 1987)
1.04 08-08-1988 0.15 1.30 Disc (August 8th, 1988)

(I'm not too sure about the [developer-only?] release of TOS 1.04 on disc
- it's been a good few years since I last used it)

MagiC 5 .11 = TOS 3.00 / DOS 0.19 / AES 3.99 / Date 11.02.97

This is may not be what you asked for, but it is interesting that MagiC has
not newer versions of TOS/DOS/AES (These version numbers has not changed since
MagiC 3,0 IIRC)

Source record: 6101

Hey everyone,

Anyone got any code on how to aplphabetical sort strings in GFA BASIC. I can do it with the QSORT command but I'm loading the strings from a file and need to remember where they were located in the file. I need to do it through some sort of looping testing for the string with the smallest ascII number. When that number is found then remember what record # it was located in and then continue compareing. Once all the strings have been compared, then I should have some sort of array hold the order in which the records should be sorted. Then all I have to do is call the records in the order of the sorted array and resave em.

Jeez this sounds easy enough but I can't seem to get the order of records to remain in an array proper.

Any Ideas?

>re-wire the mouse to woek the 286?

... because DOS wants RS232-type signals through the serial port.
There are ways to get a serial PC mouse onto the Atari but I don't
think anyone has ever had the converse requirement before :-)

Honestly, though, your best bet is to go and plead with your friendy
local PC repairer/upgrader. He probably takes in a lot of old kit
which he would normally bin.

Well unless something has changed since Magic 5.03 then the Tos version
for it depends on the machine you are running on. On a Falcon Magic
always returns a Tos version of 4.00, I assume the 3.00 is what is
returned on an ST/TT.

A part of the old ST TOS (was it?) called line-A used to have some
routines for simple sprites. These are software sprites though, not
hardware ones like on the C64 or Amiga. The line-A routines are probably
quite fast on a plain old ST, but newer machines (Falcon, TT, Atari clones)
don't support them any more, so using them is no longer reccomended.
You should use either the VDI blitting routines or write your own using
the hardware blitter (STE, TT, Falcon) or software routines
(you'd have to write one seperately for each video mode).
Actually, writing a blitting routine isn't very hard when you know
68k assembly, should take just a few lines of code...

: the atari-formatted disk (3,5"). At least we would need an ascii-file.

The disk-format shouldn't be a problem, Atari uses PC-formatted disks.
You'd have to run an emulator with Signum to convert the text files
to ASCII though, or use a converter (does one exist?) or find someone
with an ST and Signum II (ahem, that migh actually be me...) to convert the
files for you.

It would be nice if there was a system level Sprite "maybe Programmable Animated PNG". This way the programmer can create a desktop clock (perhaps like the corner clocks on television in the morning). The clock would grab the immediate and five day weather information for the location that the user is connecting from and the time information off the internet, then it would draw a small sun, or moon and its appearance would change as the time changes, depending on the time of sun rise sun set. It would utilize that 5 day forecast to know which png files to display. There would be different ones depending upon whether it was going to snow, rain, etc. It could possibly also have alarm capability loading in a multimedia file (wav, picture, animation or etc.) to alert or remind you. It can even have a min/hour based auto shutdown. You indicate to it that you only want to be on the computer for 1hr 15 min. remind me of autoshutdown 20 minutes before shutdown dialogue appears. After reminding you that shutdown in 20 min. and you click on OK, or 5 sec. pass and the dialogue box closes. The program takes over and closes all files (perhaps copying the memory and current program status information to a compressed file on the harddrive for rapid resume on next bootup), disconnects from all connects and properly prepares computer for being turned off.

The sprites can also be used for animated buttons, Animated media players, like a dancing CD player. You can have little objects come out and give you reminder messages. Take the sticky notes to the next level. You can even add audio sample support so that general midi instruments sounds can be used to notify you via SAM. You can record you voice to a reminder object and when it appears. it can write "Incoming Reminder. I would just like to see a computer that was more alive (so to speak).

6057. Help -- Lattice C 5.6 Error 21: Illegal use of aggregate

Newsgroup: comp.sys.atari.programmer
Date: 1997-12-08 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <348c36ce.6704503@news.tmisnet.com>
Source record: 6108

My ambitious little database program has grown to 44K after
compiling, causing Lattice C to complain about the placement
of relocatable data more than 32K away from the statement
using the data.

So I've decided to use the 'make' feature (instead of just
#including all the source files together). The big problem:
this code fragment that used to compile perfectly now
causes Error 21: Illegal Use of Aggregate. Adding insult
to injury, it also complains about an 'ELSE without
associated IF.'

```
/* Code Fragment */

if( preferences[ PREF_SMF_YES ].ob_state & SELECTED )
{ result = form_dial( FMD_GROW, DIAL_ORIGIN, DIAL_ORIGIN,
DIAL_ORIGIN, DIAL_ORIGIN, x, y, w, h ) ;
}
else
/* Do Nothing */ ;

/* End of Code Fragment */
```

I'd appreciate any help in solving the problem!

Here we go again.

Issue 51 of ICTARI is now available at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

For those who don't know, ICTARI is the monthly(ish) disk-zine
for Atari programmers at all levels. It also needs help in the
form of contributions to survive.

This one's actually quite good, there a couple of "scoops" in
the form of a letter about GEMMA from Paul Jones, it's creator,
and the Cadenza Address Book with full sources. Thanks to all
the folk with STOS WEB-sites, they were really useful for
answering the queries of our latest subscriber. Tell your
'net-disenfranchised friends.

Have Fun,
"Augeas"

Profile and Sysinfo have different ideas about what value corresponds
with what country.

AES LANGUAGE (AES 4.1 & up) codes as follow:

0=English
1=German
2=French
3= (reserved)
4=Spain
5=Italy
6=Sweden

LANGUAGE - OS Conf. and _AKP

os_conf >> 1

Country

0

USA

1

Germany

2

France

3

United Kingdom

4

Spain

5

Italy

6

Sweden

7

Switzerland (French)

8

Switzerland (German)

9

Turkey

10

Finland

11

Norway

12

Denmark

13

Saudi Arabia

14

Holland

15

Czechoslovakia

16

Hungary

127

All countries are supported. As of TOS 4.0 the OS is compiled with text for all languages
and switches between them based on the country code stored in non-volatile RAM.
Use the '_AKP' cookie to determine the actual language in use.

Then something like:

```
flag=TRUE
while(flag=TRUE)
{
flag=FALSE
for(n=0 to size of Array1-2)
{
if Array2(n)>Array2(n+1)
then
flag=TRUE
swap(Array1(n),Array1(n+1)
swap(Array2(n),Array2(n+1)
endif
}
}
```

Sorry about the strange mixture of C and Basic, but I haven't used GFA Basic before.

At the end you will have the strings in Array2 sorted alphabetically, and Array1 will still hold the corresponding record numbers. Obviously, I'm assuming that direct string comparisions can be used (they probably can't), and that swap is a valid part of the language (it probably isn't). You may have to implemnt these yourself.

The key things to remember are that when you move the contents in Array1 you must also move the contents of Array2.

The flag ensures that the sorting process continues until all the records have been compared.

Hope it helps.

Hi Tony,

I appreciate all the enthusiasm my site seems to have generated.
I'm currently weak in the arcade area so its just beginning to evolve
and I'm just beginning to make connections with people in regards to
un-released and in-house Atari arcade projects, expect to see images and
information on prototype and unreleased arcade equipment from Atari in
the near future, I apologize that there isn't anything mysterious and
exciting in that section as of yet, I hope you liked the rest of the
site, take care and happy holidays.

0=English 1=German 2=French
3=(reserved)4=Spain 5=Italy
6=Sweden

Thanks for this Martin-Eric. I have just realised that there are, in
fact, TWO language codes for the Atari. There is the OS code in
_sysbase and _AKP and there is also the AES Lang Code.

1. It is different from the AES codes above - 0 means "USA" and 3
means "UK".

AES Language code 3 doesn't exist, because US and UK both speak
english. appl_getinfo(AES_LANGUAGE) returns the AES language.

However, OS Code and _AKP return the actual country, which is different
from AES Language because each country has different preferences on the
keyboard layout and video hardware (thus why you find it in _AKP).

I think it's more a case of Magic is looking at the machine it's being used
on and adapting it's TOS version to match. It seems this way since I use
Magic 5.11 on an STE and, although the date, GEMDOS and AES versions are the
same, it returns TOS 2.00

> to remain in an array proper.
>
> Any Ideas?
```

Try using a second array as the pointers to the strings in the first. That way you can do tests on the string array, but only swap the elements of the numeric array. Try this:

```
' Shell sort using an array as the index
'
' n& number of entries
' si& temp, used by routine
' f! flag for swap, used by routine
' i& temp, used by routine
'
' sort.me&() index array
' s$() string array, contains data to sort
'
PROCEDURE sort.array.using.index(n&)
local si&,f!,i&
FOR i&=1 TO n&
sort.me&(i&)=i&-1 ! use '=i&' if you use OPTION BASE 1
NEXT i&
si&=n&
DO
si&=DIV(si&,2)
EXIT IF si&=0
REPEAT
f!=0
FOR i&=1 TO n&-si&
```

```
IF s$(sort.me&(i&))>s$(sort.me&(i&+si&))
SWAP sort.me&(i&),sort.me&(i&+si&)
f!=1
ENDIF
NEXT i&
UNTIL f!=0
LOOP
RETURN
```

After calling the sort, you will be left with the unsorted array s$() and a 'sorted' array s$(sort.me&()). To find the raw record #, go directly to s$() and to find the sorted record #, go via sort.me&()

Finally, when saving the 'sorted' data, try this:

```
PROCEDURE save.the.sorted.data(filename.to.save.data.to$,n&)
LOCAL i&
OPEN "o",#99,filename.to.save.data.to$
FOR i&=1 TO n&
PRINT #99,s$(sort.me&(i&))
NEXT i&
CLOSE #99
RETURN
```

Hope this helps.

iirc, the PC back then had two sorts: bus mice and serial mice, serial
being the most common I think - which don't have a lot in common with
atari mice (again iirc!).

>Does anyone know how to
>re-wire the mouse to woek the 286?

This being the programming group, here's a really daft idea ...

... someone could always write a little utility so that the atari
serial port sent the required PC serial mouse info when the atari
mouse was moved on the atari. Well, I did say it was daft!!

I don't use lattice. Nevertheless some of the following will be relevent.

>to complain about the placement
>of relocatable data more than 32K away from the statement
>using the data.

PC relative code generation is limited to a maximum of a 32K offset in either direction from the "base". The base can be "code" or "data". This varies from compiler to compiler but most can be told to turn off one or both options for any particular module. In your case it sounds like you need to turn off PC relative data addressing in the module attempting (and failing) to reach the data.

The other solution is to rearrange the module linking order so that the source and target fall within 32K of each other. Not recommended until an application is completed because you usually end up spending more time juggling modules about than code writing!

>So I've decided to use the 'make' feature (instead of just
>#including all the source files together).

Good. It is not unusual for a compiler to posess an upper limit to "compilation units". Lots of smaller source code modules are better than one big one, plus it compiles faster!

>The big problem:
>this code fragment that used to compile perfectly now
>causes Error 21: Illegal Use of Aggregate. Adding insult
>to injury, it also complains about an 'ELSE without
>associated IF.'

Pity I don't know what Lattice means by "Aggregate" but I'll make an educated guess that this is a preprocessing problem of some sort. See if there's an option to dump the output of the preprocessor to a file and examine it.

```
>/* Code Fragment */
>
>if( preferences[ PREF_SMF_YES ].ob_state & SELECTED )
> { result = form_dial( FMD_GROW, DIAL_ORIGIN, DIAL_ORIGIN,
```

> DIAL_ORIGIN, DIAL_ORIGIN, x, y, w, h) ;
> }
>else
> /* Do Nothing */ ;

There's nothing actually wrong here. Therefore it stands to reason
that the compiler cannot moan about the else/if - but it does. This
leaves the conclusion that the compiler is not seeing what you've
written and this problem is almost always because CPP has changed what
you've written into something else. Bear in mind also that just
because the problem is noticed here, the fault might be quite a lot
earlier.

The other common reason is a missing brace so that the "else" falls
out of scope with its intended "if". I dismiss this here because you
say it was ok before.

>
>/* End of Code Fragment */

You might find CPP has done something like this:

if (preferences[].ob_state)

...or ...

{result=form_dial(FMD_GROW,,,,,x,y,w,h);}

>I'd appreciate any help in solving the problem!

If there isn't an option for seeing the preprocessor (CPP) output then
look up how #assert can be used.

I have no familiarity with Signum, as my Word processor is Calligrapher
(I'm happy with it). I transfer files from Calligrapher to Word 6 using
export files as Rich Text Format (RTF). This transfers all WP control
codes, and little is lose. Can Signum save files in RTF format?

Magic always returns an AES version of 3.99. I believe that it also returns
a different GEMDOS version to the ROM TOS, as it implements a number of GEMDOS
functions that are not in the earlier versions.

Yea, correct - although bus mice are all but redundant now (but not in
the days of 286s)

> This being the programming group, here's a really daft idea ...

Here is a slighty more practicle idea - albeit a tad difficult...

There are docs available instructing how to connect an Atari joystick
to a PCs joystick port. It would be feasible (AIUI) to write a mouse
driver for the PC to read from the joystick port and understand the Atari
mouse signals...

You need to turn off relative addressing and use absolute addressing. Relative addressing produce a faster code but limit your data to be located up to 32K offset from current address. Absolute addressing have no such limitation as it is absolute (You can access all the 14 meg using this).

I do not use Lattice C so I do not know where you set this option but it is normally a compilation option.

>to injury, it also complains about an 'ELSE without

> DIAL_ORIGIN, DIAL_ORIGIN, x, y, w, h) ;
> }
>else
> /* Do Nothing */ ;
>
>/* End of Code Fragment */
>

Where is your semicolon at the end of else ?
Try to end your statement and see if it compiles.
I think that's your problem or is it you didn;t include all your code for that if-else statement here?

I would not even use those curly brackets as your IF statement is a simple one. Just as follows :

```
if( preferences[ PREF_SMF_YES ].ob_state & SELECTED )
result = form_dial( FMD_GROW, DIAL_ORIGIN, DIAL_ORIGIN,
DIAL_ORIGIN, DIAL_ORIGIN, x, y, w, h ) ;
```

The "else" is also redundant as it is not doing anything. An optimising compiler will just ignore it as it produce code which do nothing.

Hi,
Signum II can't save in rtf. The best way we have found is:
1- save all images out of the file and convert them in a pc format
(gemview for example),
2- replace all "stranges" caracters (for example in french all letters
with accent) by a combinaison of caracters never used (I used | for &#65533;,
|| for &#65533;, ||| for &#65533;, ...),
3- save the file in ascii format; you loose the format of the pages.
4- import your ascii file in word and replace the "stranges" caracters,
5- save your file.
Good luck.

>with what country.
Hi Roger.

Trust PROFILE 2 and the A-Z :-)
PROFILE 2.2 is the most comprehensive and accurate program of its kind.
Sysinfo can't always be reied upon.

As far as a list of codes is concerned PROFILE 2 and the Atari A-Z should
agree and *are* right. But please note, PROFILE 2 always reports what it
finds not what the user expects it to find!

PROFILE 2 gets its country origins from 2 different places as you know and
it depends on which page you are loking at for the results - page 1 for
sysinfo and cookie page for _AKP. In addition there is also the NVRAM
settings (where applicable) where the _AKP value is set at boot up and can
also be different and of course modified after boot up to the cookie value.
There is also a difference between keyboard nationality and keyboard
language. Again, they don't have to agree it depends on what the user has set
them to!

You must read the docs for clarification.

The codes at _sysbase+$1C and in the _AKP cookie (and in NVRAM) do not have
to agree.

The former is hardcoded in ROM, the latter are softcoded and can be changed
at will by any program as can any cookie.

Some emulators get the country code at sysbase+$1C wrong. Magic v4 does this
and often incorrectly sets a US country code at this address. Naturally the
_AKP cookie is usually set correctly for UK. Again, PROFILE 2 reports
correctly what it finds!

Please contact me via email with specifics.

Hi!

> 4.01 0.30 3.31 ROM
> 4.02 0.30 3.40 ROM
Note that GEMDOS of 4.04 is not the same, even though the version number
hasn't changed.

> MagiC 5.11
> -----------------------------------
> x.xx 11.02.1997 0.19 3.99 (TOS is ROM version)
Well, it's not the ROM's version, but 2.00 for ST(E), 3.00 for TT and
4.00 for Falcon.

Ciao

Thomas

>You need to turn off relative addressing and use absolute addressing.
One simple way around this is to use multiple C source files keeping each
less than 32K when it is compiled into its object file. Link them altogethr
in the project file.

Smaller C files also makes for faster editing, keeping related functions
together and faster compiling as you can keep stable functions together out
of the way in one file and the new currently developed functions in another.

6087. Help -- Lattice C 5.6 Error 21: Illegal use of aggregate

Newsgroup: comp.sys.atari.programmer
Date: 1997-12-13 00:00:00 UTC
From: John Richardson <johnr@thedruid.demon.co.Remove.To.Reply.uk>
Message-ID: <YYTZFDAJEpk0EwaS@thedruid.demon.co.uk>
Source record: 6138

```
strads@tmisnet.com
> this code fragment that used to compile perfectly now
> causes Error 21: Illegal Use of Aggregate. Adding insult
> to injury, it also complains about an 'ELSE without
> associated IF.'

There is nothing wrong with code extract you provided, we need to see
surrounding code because errors can cascade and when the compiler finally
gets around to telling you about it, it can point to an entirely
different piece of code.

An aggregate is just another name for a structure or union. You can not test
an aggregate as you can for the likes of short and long, any attempt to do so
will result in the illegal use of aggregate message. For example:

typedef struct{
short t;
} T_TEST;

T_TEST test;

void main( void)
{
if( test == 2 ) return;
}

This would generate error 21. Look for something like it in your code.

I am not joking when I say that one mis-placed semi-colon can wreak havoc
with your compiler, check everything.

Good luck, Jr.

From: Jo Even Skarstein <josk@stud.ntnu.no>
Message-ID: <66uhen$5jg$1@due.unit.no>
Source record: 6139

Hi!

Is there a legal and reliable way of keeping track of which application
that's on top/in focus at any given time? I need this in my "Taskbar".

So far I've used both wind_get() (find the top window) and menu_bar()
(find the owner of the menu-bar), but they both fail under certain
circumstances. E.g. if a program owns the current menu-bar but has no
open windows wind_get() fails, and if the top application doesn't
have a menu then menu_bar() fails.

Sounds feasible. Do PC joysticks have >=2 button inputs? More
importantly - would a joystick driver be capable of handling input at
the rate a mouse wheel could send it?

Hmm, howzabowt leaving the mouse in the ST keyboard and taking the
input from the keyboard lead into a com port. finally there would be a
way of moving a PC mouse pointer via the keyboard!! ;-))

This is probably referring to the ability of the browser of doing shttp
(secure http). I've been told both authors of the CAB.OVLs for both
STiK/STinG and MiNTnet work on corresponding extensions.

Cheers Peter

There already is such a browser (sort of). CAB-for-MiNTnet.ovl has support
for SSL (secure) connections, however as the author is in the US he is
not able to distribute this version of the package due to stupid American
export laws.

Someone outside of the US could compile the SSL libraries, and then a capable
browser could be provided (under MiNTnet).

As for under Stik/Sting, contact the CAB.OVL authors for support.... and
for I-Connect, pester ASH.

> versions I've used/interfaced with.

> (I had a copy of the info in a _very_ old Toolbox I hacked/wrote
> [1992-ish] - so I could compare and then flag "unknown" TOS/hardware - but
> this list is now corrupted and source is unavailable (corrupted also).

I found a backup of the list in a pre-release Toolbox from just over five
years ago [xmas 1992], and was able to partially reconstruct it. It lacks
AES version (the Toolbox ran from the AUTO folder before GEM was "awake"),
and some TOS versions were just too corrupted to make sense of.

1.00 0.0D Disc 1985-05-29 (Country=0, unknown)
1.00 ?.?? ROM 1985-11-20 (UK)
1.02 0.13 ROM 1987-04-22 (UK)
1.04 0.15 Disc 1988-08-08 (UK - "Developer only")
1.04 0.15 ROM 1989-04-06 (UK)
1.06 ?.?? ROM 1989-07-29 (UK)
1.62 ?.?? ROM 1990-01-22 (UK)
3.05 0.19 ROM 1990-12-05 (UK)

These are all the TOS versions I have either owned or written for (My TT
[in front of me] has 3.05, my old Mega ST [now in storage] has 1.02)

> > > >
> > > > TOS Date GEMDOS AES
> > > > -----------------------------------
> > > 0.99 -1985

> I used to have a copy of Disc TOS (1.00), but have lost it. I faintly
> recall GEMDOS 0.13 and AES 1.0 - but don't quote me.

The version I had was actually GEMDOS version 0.0D (hexadecimal). And
from memory AES was 1.01 (not 1.10 as I recalled previously)

And "Developer only" TOS 1.4 (on disc) had AES 1.3, I think.

I'm not sure what you mean by "secure browser", but atleast the MiNTNet
OVL for CAB supports authentication and can be compiled with SSL. I believe
(although I have never used it) that never versions of the CAB-OVL for STiK
/STinG also supports authentication.

I don't think so which is unfortunate, simply because of the fact
there is no documented call to "lock the desktop" which would be
required for a appl_get_top_app() call to have any relevence. This is
assuming a "top" application can be defined at all!

Hi!

In article <rw5iuspqyyw.fsf@ozone.inria.fr>,
Dominique Bereziat <bereziat@ozone.inria.fr> writes:
> So what is the right way to use shel_write()?
Single-AES and MagiC both require the calling program to exit in order to launch the new one. That is, the correct way to use shel_write() (mainly useful for SingleTOS) is

```
shel_write();
appl_exit();
Pterm0();
```

If you want to launch a program so that the caller freezes until the child has finished, you'll have to use Pexec() instead, which has some drawbacks when used for GEM applications.

If you want to run programs in parallel, you'll have to use MagiC's "100"-parameter. This will work with both MagiC and MultiTOS/N.AES/Geneva, as the latter always spawn children in parallel.

Ciao

Thomas

6104. Serial Driver

Newsgroup: comp.sys.atari.programmer
Date: 1997-12-16 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <5b6_9712161853@conchbbs.com>
Source record: 6055

I've written a high speed serial driver which implements asynchronous block I/O. (At least I've got it working on Serial 2 of my TT so far.) I was wondering if anyone would like to suggest any improvements in the data structure pointed to by the cookie before I start on the other platforms:

```
struct ser_cookie {
long bps[16]; /* list of baud rates */

short id; /* driver identifier */
short ver; /* version number */

void cdecl (*write)(struct ser_block*); /* block write */
void cdecl (*read)(struct ser_block*); /* block read */
void (*flush)(void); /* flush all queued I/O */

void (*error)(void); /* user supplied read error handler */
void (*dcd)(void); /* user supplied loss of DCD handler */
void (*break)(void); /* user supplied break handler */
};

struct ser_block {
void *pbuf; /* data buffer */
short size; /* number of bytes to process */
void cdecl (*done)(struct ser_block*); /* user supplied handler */

short volatile status; /* 0=busy, -1=done, 1=quick, 2=flush */
short index; /* reserved */
void *next; /* reserved */
};
```

The driver supplied functions MUST be called in super mode. All registers, including the status register, will be preserved. If status==1 (quick) on return, it means that the operation was completed before returning and the (*done)() function will NOT be called.

All of the user supplied handlers are called in super mode but with interupts enabled. All registers are saved prior to calling. A NULL pointer can be used to disable any handler.

One can queue many (*block_write)() requests (using a different ser_block structure for each call), and intermix with BIOS write calls, and all of the bytes will be sent in the correct order.

One can queue (*block_read)() requests too, but BIOS read will wait until ALL queued block read requests are handled. OTOH, if there

are any bytes in the IOREC buffer when (*block_read)() is called,
they will be copied into the block buffer.

The (*flush)() function will call all of the queued (*done)()
handlers with status==2, in order to conveniently handle any dynamic
RAM allocation.

Note: It is possible to call the block I/O functions from within a
(*done)() handler. To prevent recursion, one should turn off
interupts first.

I don't see how this makes such a function irrelevant. What do you mean by
"lock the desktop" anyway?

: assuming a "top" application can be defined at all!

Well I would define the top application as the one with the tick by it in
the Desk menu. I guess this would be the app that's currently receiving
keyboard presses.

>I don't see how this makes such a function irrelevant.

Let us assume appl_get_top_app() exists and returns the i.d. of the
top process ...

>What do you mean by
>"lock the desktop" anyway?

Keeping the component parts which define a "top" application in a
consistent state so that the information returned by
appl_get_top_app() can be made use of. Otherwise, all we can say is
that some process was the top app at the time of our call but might
now have changed - we cannot tell, therefore the result we obtained is
useless.

>: assuming a "top" application can be defined at all!
>
>Well I would define the top application as the one with the tick by it in
>the Desk menu.

The problem is defining which application gets the tick. It has to be
consistent across all Gem operating systems.

>I guess this would be the app that's currently receiving
>keyboard presses.

If forced to make a definition I'd have to agree. The reality of the
situation however, is there is no such thing as a top application. It
is a concept invented by us and of no importance to Gem.

This "program chaining" is the only mode available to a singletos
shel_write() call. Your only other solution is to use Pexec().

6108. Atari system character set

Newsgroup: comp.sys.atari.programmer
Date: 1997-12-17 00:00:00 UTC
From: josdb@xs4all.nl
Message-ID: <349809ea46631b1@xs4all.nl>
Source record: 6059

Hello,

I have only recently learned that the Atari system character set can
vary greatly in different countries. From the beginning, for instance,
there has been a Polish Atari with Polish characters in place of the
Hebrew ones in the UK and, I suppose, the American machines.

Does anyone know how many different system charsets there are and
which characters they contain? Or where I can get this information?

Thanks in advance.

those tend to crash on you.)
As far as I know Stienberg still sopports the Atari version,
So even though it's some money, it is well worth it.Cubase is
great on an atari!

Seems strange but I can't make any cli understand reading a file instead of stdin to redirect arguments.

```
ls | expandar
mkdep < list
```

The argument coming to the program is always empy, with okami, CMD or mupfel CLI, where am I wrong ? Doing:

```
dir | more
```

does work well, so what ? I am programming in C but this should not be the problem, the environment is magic+thing.

What is wrong with HSMODEM that you've built your own ?

Dunno about John's reason, but unpublished sources and an uncooperative
author that never even replies to e-mails is a good enough reason to me.

For instance, Harun suggests if someone ever wants to write proper
drivers for MiNT that use the HS-Modem functions, to contact him.
Several people have, but we still don't have XDD versions of HSM,
because Harun apparently doesn't agree with the programming ideas
of those who contacted him...

I realize not everyone likes the idea of sharing their sources,
but since I got into MiNT and the whole Linux / GPL world, It's
become typical for me to recompile things to my own tastes. GPL
also allows people to further improve someone else's work.

Before HS-Modem, there was Franz Sirl's Fast_Serial, which could
detect and adapt to various SCC substitutes and PCLK frequencies.
While it wasn't perfect, I'm sure there are people who could have
further improved Franz' work, if the sources ahd been published.
But now, Franz has apparently left the Atari scene and vanished
without a trace and his sources long gone.... :-/

An errata file is found at my web site in signature below.
The relevant bit you want is:

6.138 (shel_write() - table)
shel_write() mode 1 should have a wisgr paramater of 0 to launch a TOS application or a wisgr parameter of 1 to launch a GEM application.

If not multitasking use Pexec().
If multitasking use shel_write().

Something like:

```
#define SHW_CHAIN 1 /* Normal shel_write mode */
#define SHW_PARALLEL 100 /* MagiC parallel shel_write mode */

int LaunchProgram()
{
int ret;

if (!multitasking)
{
if (window == OPEN)
CloseWindow(whandle, TEMP);
Disablemenu(); /* except Desk menu for accessories */

pexec_return = Pexec(0, program_path, string, NULL);
ret = (pexec_return < 0) ? FALSE : TRUE;

Enablemenu();
OpenWindow(whandle);
}

if (multitasking)
{
if (magic)
ret = shel_write(1, 1, SHW_PARALLEL, program_path, string);
else
ret = shel_write(1, 1, SHW_CHAIN, program_path, string);
ret = (ret > 0) ? TRUE : FALSE; /* ap_id of program returned */
if (geneva_cookie && (ret == -1)) /* program loaded in single- */
ret = TRUE; /* tasking mode return -1 */
}
return ret;
```

```
}

I do not really know, but I suppose there is one for each language you
could get the machines in. IIRC the language identifier is 4 bits in a
number contained in the SYSBASE structure, a pointer to which can be
found in the system variables. So this corresponds to sixteen languages
in which the machines were available.

You should note however even with older versions of NVDI you can install
any other font as the system font. Considering this, there is an almost
infinite number of different system charecter sets.

Ys, but my point was: has Atari delivered machines with that many
different system character sets? And if they have, what were the
languages and what were the specific codes/characters?

>You should note however even with older versions of NVDI you can install
>any other font as the system font. Considering this, there is an almost
>infinite number of different system charecter sets.

Oh, yes, I know. And even before NVDI existes there were programs that
allowed you to change the system font to your heart's desire. But
those are individual customizations.

Anyway, I was hoping Atari had systemized its character sets roughly
along the lines of the iso-8859-x sets, but this is most probably not
the case. The national variations for languages with Latin based
alphabets were probably only in the range of what in "normal" Ataris
are the Hebrew characters, making it impossible to write conversion
routines for all the languages in one iso-8859-x group.

I was particularly wondering: are there Ataris with Cyrillic and
Arabic characters sets?

Thanks for your reaction.

At _sysbase+$1C and is diagnosed by programs such as Profile, Sysinfo.

>You should note however even with older versions of NVDI you can install

>infinite number of different system charecter sets.

I'm not sure how relevant this will be to Jos but the system char set
can be changed by programs such as Tastset and Key_Edit.

Also .... when Magic is installed it will copy the CURRENT character
set into MAGIC.RAM so that this set will be used whenever Magic is
run.

Message-ID: <Pine.SUN.3.95q.971220050423.14937A-100000@ganymede.cs.mun.ca>
Source record: 6071

Hi everyone,

I'm trying to do a pretty basic screen scroll in GFA but It don't want to work the way I want it to. First I write to the physical screen XBIOS(3) and then I activate the logical screen XBIOS(2). I then write to the logical screen. What I want to accomplish is to have the logical screen (graphics) replace the physical screen graphics. But I want to have the logical screen look like it is falling from the top of the screen and bump the physical off the page e.g logic scrolls down and phycal screen scrolls down evently all the way off screen. I've got some old BMOVE routines but they only make use of scrolling one screen. Anyone one got anything kicking around.

Thank's
Scott.

Source record: 6073

rich@demon.nl
> I want to experiment with computer generated compositions, but i
> don't know how to control the MIDI-ports...

The easiest way is to get a copy of HSMODEM6. You can then access the
midi-ports as if they were files, eg:

```
FILE *midi;

midi = fopen( "U:\\DEV\\MIDI" );
```

You can then use the whole standard C library for the midi-ports exactly as
you would for a file.

The next easiest is to use the BIOS functions, Bconout(), Bconstat(),
Bcostat() and Bconin().

A simple example program to send some data to the midi-port:

```
#include <dos.h>

int main( void)
{
char data[9] = {1,2,3,4,5,6,7,8,9};

int idx = 0;

while( idx < 9 )
{
/* wait until MIDI port is ready to recieve, you sould
probably include some time out code here too */

while( !Bcostat( 3) );

/* send data to the MIDI port */

Bconout( 3, data[idx++] );
}

return( 0);
}
```

When reading data replace Bcostat with Bconstat and Bconout with Bconin.

The most difficult but most efficient way is to access the MIDI
controller directly. This can be done in C but is best done in assembly. I'll
not go into details here as either of the above should be sufficient for most
purposes.

Jr,

Yes, that's right. If you make sure the char. set is OK (using the
AUTO produced by key_edit, for instance) when you install Magic you
will get that char set installed whenever Magic is loaded. No need to
use the key-edit AUTO again.

```
>
> -Where can I find some _good_ documentation on how to use
> GEM/AES from GFA-Basic..?
```

Probably your best bet is too start with GFA Fly4.9 until you're a bit more confident about what you're doing. Good sources of GEM doc documentation specifically related to GFA are dificult too find, but use something like the Atari Compendium should get you started. Also check out the GFA FAQ:

http://www.geocities.com/Athens/5272/gfafaq.htm

```
> -How do I get Flying Dialogs 4.9 to work? (Nukes me every time!)
```

Start with the example program and begin finding out how it works, then move on from there. (Mail me privately if you need some help)

```
> -Are there still people using GFA..?
```

Yes!!

```

: CLI, where am I wrong ?
Well, what do you expect? It sounds to me that you expect argc being > 1
in that case, but that won't happen. IO-redirection does just that: it
redirects stdin, stdout or stderr to a file or pipe. It does not influence
a program's arguments in any way, i.e. the "< list" will not be passed to
mkdep in the above example, but evaluated by the CLI.

If you need to know whether stdin/stdout/stderr are no longer connected
to the terminal, use isatty(), which will report 1 if the requested stream
is associated with a TTY (Terminal TYpewriter) or 0 in the case of
redirection to a file/pipe.

Ciao

Thomas

6130. Reading configuration files

Newsgroup: comp.sys.atari.programmer
Date: 1997-12-22 00:00:00 UTC
From: kma54@csc.canterbury.ac.nz
Message-ID: <BAatC+bxS5eN@cantva.canterbury.ac.nz>
Source record: 6081

Greetings all,

I'm interested in having the programme that I'm developing obtain
its path and variable settings from a file, but to have this file
human readable so it can be adjusted by the user to suit his or her
requirements.

An example:

This is an extract from the configuration file qed.cfg (from the text
editor qed v4.0)

```
GdosFontID=0
GdosFontSize=10
GdosMode=FALSE
GemdosDensity=0
GemdosDriver=""
GemdosNLQ=FALSE
GemdosPageHeight=65
GemdosPageWidth=80
GlobalAutosaveCfg=FALSE
GlobalBinLineLen=80
GlobalBlinkCursor=TRUE
GlobalGEMClip=TRUE
GlobalOverwrite=FALSE
GlobalTransSize=100
GlobalWindCycle=TRUE
HelpProgram="C:\ST-GUIDE.APP"
LocalBegin="*"
LocalBackup=FALSE
LocalBackupExt="BAK"
LocalInsert=TRUE
LocalKurzel="D:\EDITOR\QED-400\TAGS\STG.KRZ"
LocalTab=TRUE
```

or one like what ST-GUIDE uses...

```
# Default search path, where ST-Guide looks for 'HYP' hypertexts:
PATHS=C:\GUIDES;A:\GUIDES
#
# HCP is used to compile STG files into HYP files. STool uses this
# entry to find HCP and compile:
HCP=C:\ST-GUIDE\HCP.TTP
#
# Hypfind is called by ST-Guide to search for search masks in all
# pages in the current hypertext.
```

```
HYPFIND=C:\ST-GUIDE\HYPFIND.TTP
#
```

Where the hash '#' symbol denotes a comment line.

I'm using a C compiler (Lattice 5.6) Should I be using switch statements, structures, if else or global variables?? I'm a bit stuck for an elegant way of doing this.
If someone could shed some light on this, by way of pointing me to an appropriate web site, or recommending a suitable book or similar, I'd be most grateful!

Thanks,

I get the impression that you want the output of one command to appear in
the command line of another command. This is done with back-quotes, ie
the character '`'. Not all shells support them. Gulam, which I use on my
atari, doesn't. I dial in to a UNIX system which does allow them, though.

If you put back-quotes around part of the command line, the shell runs
the quoted part, saves what it send to stdout, then runs the command with
the quoted bit replaced by the output of running the first command. I
guess it's easiest to explain by example.

If you type
cat `echo foo.txt`
the part "`echo foo.txt`" will be replaced by "foo.txt". The command line
passed to cat will be "foo.txt", so it will print the contents of the file
foo.txt on stdout.

If you do
cat `echo foo.txt` <bar.txt
the result will be the same, because cat does not read it's stdin when it
has a command line to tell it what file to use. i.e. The command line cat
see's is "foo.txt".

These examples are, of course, trivial. On the other hand, it is very
usefull if you have a file which is a list of files, and you want to
display all of them, one after another. For example, list.txt is a list
of C source files for your program, like this
header.h main.c getline.c sort.c output.c

to display all these files (assuming they are in the same directory as
list.txt), you can

cat `cat list.txt`

the "first" cat (not inside the back-quotes) gets
"header.h main.c getline.c sort.c output.c" on its command line, so it
lists all the files.

assuming "edit" is the editor you normally use,
edit `grep -l typo *.txt`
will run edit on all the files that contain "typo". (grep -l lists files
which have matches in them, but does not actually print the matching
lines)

Hope this info helps,

Peter Cordes

I could write a MiNT specific serial driver, but MiNT does not
support asynchronous I/O, nor do I use (or ever intend to use) MiNT,
so it is of no interest to me personally.

(Frankly, it wasn't that difficult. The biggest stumbling block was
due to a documentation/implementation error in the TT.)

My next project is to write my own PPP and TCP/IP interface which
will use my serial driver.

I HAVE to strongly discourage you from undertaking such a project.

We already have WAY too many TCP/IP stacks on Atari; making yet an
other one would only further divide and confuse users.

STiK/STiNG and MiNTnet were already enough.
ASH's PPP-Connect was NOT a welcome addition.

Unless your driver will be totally BSD compatible (ie: allows porting
Linux and BSD stuff by simply changing the bindings like on MiNTnet),
your new stack will NOT be welcome either.

ASH should have standardized on a MiNTnet clone optimized for MagiC;
so should you if you really want a pick at the TCP/IP scene on Atari.

My opinion anyways.

Hi,

I haven't written a program that does this, but I would do it with global variables. I think it could be elegant if you treat them as symbolic constants, i.e. pretend you had
#define MaxWidth 20

As long as you aren't using globals to pass values into and out of functions you should be fine. The first thing your prog does should probably be reading the CFG file, so the rest of the program can assume that the variables are predefined and never change (of course, it should be the case that the values are predefined and unchangeable). This means that you might find it difficult to let the user configure the prog with menu choices, but I imagine it could be done.

Good luck and merry Christmas

> requirements.

A sensible decision.

> I'm using a C compiler (Lattice 5.6) Should I be using switch
> statements, structures, if else or global variables?? I'm a bit stuck
> for an elegant way of doing this.

The way I do this is quite a complex method, but it is quite an
elegant solution (IMO) and is extremely simple to support extra
variables, or multiple config files/types.

```
typedef struct
{
char *option_name; /* command line arg. or keyword */
enum /* type of this option */
{
OPT_BOOLEAN, /* boolean */
OPT_INTEGER, /* integer */
OPT_STRING, /* character string */
OPT_END /* end of the options description */
} opt_type;
void *data_ptr; /* pointer to the data */
} OptDesc;
```

with a table somewhere in the program which defines the recognised
options - eg:

```
Bool Debug = TRUE; /* are we debugging? */
Bool Quiet = FALSE; /* don't play a sound when an object is selected */
Bool Expert = FALSE; /* don't ask for confirmation for some
operations */

OptDesc options[] = /* description of the command line options */
{
/* option name type where to store the value */
{ "debug", OPT_BOOLEAN, &Debug },
{ "quiet", OPT_BOOLEAN, &Quiet },
{ "expert", OPT_BOOLEAN, &Expert },
{ NULL, OPT_END, NULL }
};
```

The "where to store the value" things are pointers to global variables - which could be members of a global structure, or indexes into an array, or however you
want to store the data - but pointers is quite a simple method, IMO.

We simply have a piece of code which compares the input line with the options, and stores the value (after doing a little housekeeping, like skipping blank space, etc) - eg:

```
void ParseConfigFileOptions( char *filename)
{
FILE *cfgfile;
char line[1024]; /* max 1024 char line! */
char *value;
char *option;
char *p;
short optnum;

if ((cfgfile = fopen (filename, "r")) == NULL)
{
form_alert(1,"[2][Warning: |Configuration file |not found.][ OK ]");
return;
}

while (fgets (line, 1024, cfgfile) != NULL)
{
if (line[0] == '#' || strlen(line) < 2)
continue;
if (line[strlen(line) - 1] == '\n')
line[strlen(line) - 1] = '\0';
/* skip blanks before the option name */
option = line;
while (isspace(option[0]))
option++;
/* skip the option name */
value = option;
while (value[0] && value[0] != '=' && !isspace(value[0]))
value++;

if (!value[0])
ProgError("invalid line in %s (ends prematurely)", filename);

if (value[0] == '=')
{
/* mark the end of the option name */
value[0] = '\0';
}
else
{
/* mark the end of the option name */
value[0] = '\0';
value++;
/* skip blanks after the option name */
```

```
while (isspace(value[0]))
value++;
if (value[0] != '=')
ProgError( "invalid line in %s (no '=')", filename);
}

value++;
/* skip blanks after the equal sign */
while (isspace(value[0]))
value++;

for (optnum = 0; options[optnum].opt_type != OPT_END; optnum++)
{
if (!stricmp(option, options[optnum].option_name))
{
switch (options[ optnum].opt_type)
{
case OPT_BOOLEAN:
if (!stricmp(value, "yes") || !stricmp(value,
"true") || !stricmp(value, "on") || !stricmp(value, "1"))
*((Bool *) (options[optnum].data_ptr)) = TRUE;
else if (!stricmp(value, "no") ||
!stricmp(value, "false") || !stricmp(value, "off") || !stricmp(value, "0"))
*((Bool *) (options[optnum].data_ptr)) = FALSE;
else
ProgError("invalid value for option %s:
\"%s\"", option, value);
break;
case OPT_INTEGER:
*((short *) (options[optnum].data_ptr)) = atoi(value);
break;
case OPT_STRING:
p = GetMemory((strlen(value) + 1) * sizeof(char));
strcpy(p, value);
*((char **) (options[optnum].data_ptr)) = p;
break;
default:
ProgError("unknown option type (BUG!)");
}
break;
}
}
if (options[optnum].opt_type == OPT_END)
ProgError("Invalid option in %s: \"%s\"", filename, option);
}
fclose( cfgfile);
}

Other types, like OPT_FLOAT, OPT_FILE, OPT_PATH, or OPT_LIST could be
implemented relatively easily... Also, you can add a "short-name" field
to the parameter and use it to compare against command line options
```

(eg "-d" for debug mode)

> be most grateful!

An example of where a slightly more complex version of the routines posted above can be found in GEM-DEU (source distrib), which is available for download from my WWW pages: http://www.users.zetnet.co.uk/~jacquesa/
- the relevent routines/structures are in DEU.C and DEU.H

Hope this helps

Isn't division and confusion what the free market is all about?
Having choices implies having to make choices.

Actually, I don't want to get involved in TCP/IP at all, but I can't
expect someone else to get all excited about asynchronous I/O
(especially if they come from a UNIX background).

Hi, all. I wonder if it's possible to make the VDI functions V_FTEXT or V_GTEXT or similar calls to print the text in inverse mode? Without having to set the writing mode to transparent, clear the background to black, text to white and then print it. Anyone?

Join the club! This is one area of programming which has always
annoyed me because it usually involves all sorts of compromises.

>If someone could shed some light on this, by way of pointing me to an
>appropriate web site, or recommending a suitable book or similar, I'd
>be most grateful!

I'm afraid the best way is to figure it out yourself, you being in the
best position to know what is required!

The most generic solution is probably to think along the lines of a
database where you can store string or numeric data, each with an
associated name. However, there is another consideration which can
turn this into overkill - eventually you need to process the data. At
some point your code will have its behaviour modified by the data
(otherwise there's no point in having that item of data) thus
rendering a generic solution somewhat obsolete. ie if you must
explicitly test the data at some point anyway, why not parse it there
as well? (Actually this is not quite such a good idea - no point
having to back out of many layers of code when an error is detected
when it could have been parsed earlier). My point against generic
solutions is hopefully clear though!

Looking from the opposite point of view, explicit parsing can involve
lots of repetitive chores - the sort you end up with when initially
parsing argc,argv then add further command line options to over time
resulting in a mess which you know ought to be sorted out but never
get round to do.

Possibly the more important questions are ...

How much data is to be processed from the file?

How different is it from other data items? ie would the various items require specialist handling or could a general algorithm be considered suitable?

Will it change considerably from the initial specification? ie will regular maintenance/updating be required?

Will you ever be needing similar data processing code in other applications? ie although a generic solution might not quite fit the ideal for this program, might it do so, if you take future projects into account?

I tend to favour a mixture. An array of strings to hold the tokens (PATH= etc) and an array of function pointers (or a token & function set for numerics, a token & function set for strings etc). When a match is made, the corresponding function is called which performs the more specific tasks associated with the token. This method also allows each function to convert its input data into exactly the format which is best for the program "guts" to process - and allows very specific error messages to be constructed if desired. Aside from the obvious disadvantage of having lots of functions which only get used once (and possibly declaration problems), this method does tend to require intensive dynamic memory usage which of course, brings its own set of problems. For a few datafile items, or where all items need the same parsing, this method cannot be recommended. On the other hand, adding new tokens as things progress is trivial.

Hi,

I don't have any of my own sources handy, so I can't give you a programming example.
However, here is the idea. I am sure that you won't have problems using it.

- Define a virtual workstation (say W1) with the attributes you want to write
"normal" text, usually in replace mode.
- Define a virtual workstation (say W2) with attributes to draw in EXCLUSIVE OR
mode.
- Write any text you want using W1.
- When you need to invert some text:
* Get the coordinates of the rectangle that the text covers.
* Using W2, draw a black rectangle with these coordinates, i.e. on top of the text.

That's it!
You know, everytime you draw something with all bits at 1 with W2, you just
invert the values of the bits there.

Hope this helps.

The VDI functions v_rvon() and v_rvoff() should be what you're looking for.

EXCLUSIVE OR mode.

what a complex way to revert bits !!!!
i think the best way it's to vro_cpyfm
the text in (not destination) mode or even
in (not source) mode which will be
approx. two times faster than the xor mode
(especially if you are using Nvdi or so ....)
and requires only one workstation too....

merry xmas too...ooh..a little bit late i think :))

do you want to know how it works internally
or how you could call it externally ??
in the second case i can send you information
,in fact it's quite simple you just have to locate
the cooky which points to a table of vectors
that you jump thru to open the driver, then to
get info about the picture etc..etc...and finally
to close the driver...
there are some cool features such as 16 bits
output so that you can display easily using falcon
video modes...
for more details ans example code fragments
please contact me by e-mail (i recommend
phenix@writeme.com)

What precisely do you expect it to do, and what precisely do you want to use
it for, and what precisely does it do when interpreted, which it doesn't in
compiled code ?

I find it difficult to imagine an application for shel_write() in interpreted
code.

Right. However, having choices requires standards. Otherwise, I can't choose what TCP/IP stack to use with my browser and other user programs (which only support one standard).

```
So, a new IP stack to choose from might be good - as long as it is
compatible to an existing one (preferrably MiNTNet) as far as user programs
are concerned.

I have in problem in the Atari NOS development. I get a DOS_XFS error in MagiC 5.03 that locks the system.

- the error seems to appear while trying to fclose a file that was also fopened and fclosed in a (parallel) subroutine.

- I could only test the error in MagiC 5.03 on an Atari TT030

- there is no error on plain TOS and MagiCPC (MagiC 05.02)

- I tryed cbhd and hddriver, various AUTO combinations

- no documentation about that DOS-XFS error

- NOS actually compiled with Lattice C

What could be responsible for this error ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Well, David, I am not sure that the subject is worth a discussion... However, let's go, just once. I respect fully your opinion, of course, so what follows are only comments.

In article <01bd13d9$27511c60$1e0844c3@p-d-mou>, "Centek" <Acces.Journaliste@wanadoo.fr> writes:
>> - Define a virtual workstation (say W2) with attributes to draw in >
>>EXCLUSIVE OR mode.
>what a complex way to revert bits !!!!
No, it is not complex! For any program of significant size, opening at the beginning several virtual workstations with various attributes is easy, facilitates further calls, and is good programming practice anyway (they were invented just for this).

>which will be approx. two times faster than the xor mode
OK, OK. I was not personnally concerned about display time for these inverted areas...

>i think the best way it's to vro_cpyfm
Let me tell you that the use of vro_cpyfm looks to me far more difficult than the v_recfl call that I proposed.

My best regards, David.
